

BizTrack — System Testing Checklist Verification

An independent audit of all 121 checklist items against the code as it stands today

Source checklist: SYSTEM TESTING CHECKLIST (2).pdf — 39 pages, 121 items, six checking rounds from 24 July to 5 August 2026

Audited against: main at cdde383 , working tree clean

Report date: 5 August 2026

Scope: verification only — **no code was changed, no database row was altered, nothing was deployed**

How this was verified

Twelve independent auditors were run across the twelve subsystems the checklist touches. Each was given the verbatim item text (including what the screenshots showed), and each was required to reach its verdict from the code rather than from any prior status report.

The evidence standard was deliberately strict:

- Every verdict cites a file and line, a commit hash, a database count, or an observed HTTP response.
- No item was marked done because an earlier document said so. Where the project's own handoff contradicted the code, **the code was treated as correct and the document recorded as wrong** — four such corrections appear in Appendix B.
- Where a claim could only be settled by running something, it was run: API calls against the isolated stack on 127.0.0.1:5199 , read-only queries against the tester database, and PDF renders converted to images and actually looked at.
- Items needing a decision from City Hall are marked **BLOCKED**, not “pending”. Items that could not be settled without mutating tester data are marked **CANNOT VERIFY** with a note on what would settle them.

The live tester database was treated as read-only throughout. It holds real filings from Malabon City Hall staff — 84 users, 797 businesses, 1,710 applications, and activity as recent as the morning of this report.

Where the 121 items stand

Verdict	Count	Meaning
DONE	73	Verified fixed in code, with evidence
PARTIAL	38	Substantially addressed; a specific, named remainder
NOT DONE	8	No implementation found
BLOCKED (LGU)	5	Waiting on a City Hall answer or document
SUPERSEDED	4	Overtaken by a later item that reversed it

Verdict	Count	Meaning
CANNOT VERIFY	1	Analysis provided; action requires your decision

129 verdicts for 121 items – items 111 and 121 each carry five sub-parts, graded separately.

The headline is that **121 line items are not 121 problems**. Across six rounds the same complaint was often refiled two to four times as it was re-observed. Collapsed by root cause, the checklist describes roughly **60 distinct problems**, of which the substantial majority are closed. The clusters are mapped in Appendix C.

Five findings that should be read before anything else

1 – Office separability is not complete, and the gap is in the payload the review screen actually reads (Item 111e). `OfficeFormController` correctly scopes each office to its own sheet, and that endpoint was verified working. But `ApplicationResource.php:78–85` emits `office_forms` with no filter, and that resource backs both `GET /assignments/{id}` and `GET /applications/{id}` — the calls the officer Review page makes. Observed live: a City Health officer opening one filing received BFP's, OBO's and CENRO's form answers in full, including a `owner_birthday` recorded on CENRO's sheet, plus every office's assignment remarks and BFP's inspection findings verbatim. The scoping rule already exists; it is simply not applied on this path. This fails the tester's own acceptance sentence literally.

2 – Documents 404 because one database is shared across two storage trees (Items 65, 111a, 121b). `scripts/demo-up.sh` points the demo API at the *main* worktree's database but runs it from the *demo* worktree, so uploads land in one storage tree while the other API looks in the other. Measured: of 170 document rows, 121 exist only under the main tree and 49 only under the demo tree — **zero exist in both**. The tunnel 404s on 121 of them, the dev API on 49. The affected files are precisely the testers' own uploads from 3 August onward, which is why they hit it and we did not. The download code is correct; the storage root is not. Do not repair this by rewriting `stored_path` values.

3 – Payments can never be real, and the receipt no longer says so where it counts (Item 75). `PaymentGateway::charge` unconditionally records success. `PAYMENT_DRIVER`, documented in the deployment runbook, **is not read by any code** — there is no config binding, no interface, no second implementation. Every receipt ever produced records that no money moved. The watermark was removed as requested; what prints now is headed `CITY OF MALABON`, titled `OFFICIAL RECEIPT`, with a `TOTAL PAID` line, and the only contradicting text is a 9-point grey footer that does not survive a crop, a photocopy, or a phone photo. Three options are set out under Item 75; reinstating a tuned watermark is the recommendation.

4 – Four things the browser requires, the API accepts anyway. A filing can be submitted through the API with **zero clearances** (observed: HTTP 200, status `pending_payment`, tracking `BIZ-2026-00479`) — Items 76 and 120. Emergency contact name and number carry a red asterisk on screen and `nullable` on the server — Item 12. Capitalization is required client-side only — Item 35. Map coordinates have **no server-side geographic constraint at all**, so a pin can be stored anywhere on Earth — Items 86 and 121a. In each case the guard exists in React and stops at the browser.

5 – The “Other Requirements page crashes” reports are not application bugs (Items 83, 100). The error string in the screenshot appears in exactly one branch of `toApiError`: a response carrying an HTTP status but no Laravel envelope. The API answers every error with an envelope, so the body was never ours — it was the tunnel returning an HTML error page. Every endpoint that page uses returns 200 locally. The fix that makes this legible, `9f3b489`, **is written but not deployed** — so a tester on the tunnel today still sees the misleading wording. There is nothing to repair in the page itself.

Decisions only you can make

These are not engineering gaps. Each is a place where the checklist asks for two incompatible things, or asks for something that trades against a deliberate safeguard.

#	The tension	What is needed
33 vs 71	Item 33 wants Zoning as step 1; item 71 wants Data Privacy Consent first or last. Both cannot be first. The build honours 71 (the later filing) and makes Zoning the first data-collection step.	Confirm the consent gate stays at step 1.
121d / 121e vs 78	Item 78 asked for the dashboards to move to BPLO, and that was implemented. Items 121d and 121e now ask for BPLO to lose Processing Time and the super admin to lose everything else. Taken literally, 121d also strips the super admin of analytics export and refresh.	Confirm the intended split. Ties to open question B12 — who the super administrator is in practice.
120	“The other five permits are required.” Making five clearances compulsory decides, on the city’s behalf, that every business in Malabon needs Zoning, Sanitary, Fire, Environmental and Occupancy. Open question A9 names the risk: a small retailer who legitimately needs none would be blocked.	A BPLO ruling (question A1/A9). Note the server-side gap under item 76 should be closed either way.
116(a)	Removing “These figures are not part of the zoning decision” is currently safe , because the CPDO attribution sits directly above the panel in the same modal. It stops being safe the moment that line moves.	Nothing now — but if that paragraph is ever relocated, the disclaimer must return.
18	Removing Revenue Code citations was requested. Those citations are also the only way an applicant can check they are being charged lawfully — and this system computes fees automatically from a transcribed ordinance, which is exactly where a silent error would hide.	A BPLO ruling (question A12). A middle path exists: keep the ordinance name in the footer, drop the per-line sections.
89 / 57	“Let the admin choose the recipient” was built as a control that <i>names</i> the recipient, not one that <i>chooses</i> it. The reasoning is sound — only business owners can answer a request — but it is not what was asked.	Confirm whether you meant “say who this goes to” (done) or “route it to another office” (not built).

#	The tension	What is needed
75	Watermark removal versus a document that reads as proof of a payment that never happened.	Pick one of the three options under Item 75.
80	Six offices have no Reject button by design — a per-office rejection has no state in the workflow and would stall progression. They have “Return with remarks” instead.	Confirm whether office-level rejection is genuinely wanted; if so it is a workflow change, not a button.
117	Roughly 9 live business rows carry obviously fake TIN/registration values, and 146 applications reference soft-deleted businesses.	Nothing was deleted. This is real tester data; any cleanup needs your explicit go-ahead, taken outside a live session, with a backup first.

Waiting on Malabon City Hall

Five items cannot progress without an answer or a document, and they map onto questions already on file in `docs/questions-for-malabon.md`:

Item	Blocked on
52, 82, 84	§E2 — the paper amendment form. It has never been seen, so “the amendment form is incorrect” cannot be verified against anything.
18	§A12 — may Revenue Code section numbers be shown to applicants?
28	§B4 — an SMS gateway and an official city sending domain. Nothing is delivered today; mail goes to a log file and SMS to <code>sms.log</code> .

Also unanswered and shaping open items: **A1/A9** (who decides which clearances), **A9b/A9c** (Market Clearance and stall counts), **A13** (“Others” on the trade list), **A20/E3** (which identifier a renewal should ask for), **C6/C8** (a hydrography layer and the real city boundary), **D2/D3** (the office’s own vocabulary for analytics terms).

Item-by-item findings

Ordered by checklist number. Items 111 and 121 are graded per sub-part.

Item 1 **PARTIAL**

Checklist: Edit profile is not working properly.

Evidence: Modal wired end-to-end: `web/src/pages/SettingsPage.tsx:167–195` PUTs `/auth/profile` with `first_name, middle_name, last_name, suffix, gender, mobile_number`, then `setUser(data.data)` refreshes the session; `AuthController.php:214–260` validates and saves those exact six, with `Audit::log('user.profile_updated')`. Route `api/routes/api.php:22`. 8 Pest cases in `ProfileTest.php`. Live at `:5199 /profile`, stored values render (Gender “Female”, mobile 09171234567 for owner@), so writes reach the DB. **The one control that does nothing:** `SettingsPage.tsx:247–249` — `<button type="button">Edit Profile Picture</button>` has no `onClick`, no file input, no upload call. There is **no avatar storage anywhere in the backend** (repo-wide search for `avatar|profile_picture|profile_photo` in `api/app`, migrations, `web/src/lib/types.ts` returns only `Inspection.photo_paths`), and `ProfileAvatar` on both Settings and Profile is a hard-coded SVG (`SettingsPage.tsx:33–45`, `ProfilePage.tsx:77–89`).

What's left: Either implement avatar upload (column + storage + `updateProfile` handling + `User` resource field) or remove/disable the affordance so the modal does not advertise a capability that does not exist.

Risk/Notes: Did not submit the modal against the shared tester DB, so “saves correctly” is established from code + tests, not an observed round-trip.

Item 2 **PARTIAL**

Checklist: The application form does not match the real (paper) application form.

Evidence: `fa3f107` (08-05) transcribed the client's paper forms into the intake — code carries the paper's own item numbers: `ApplyWizard.tsx:309` (“BPLO items A6 and A9”), `:2322–2323` (“The fields transcribed from the paper BPLO form... none of the three paper forms marks any field required”), `:4174` (“Citizenship (of President/OIC)”), `:3086` (section A and items B6/B8). Zoning sheet rebuilt against the real MCG-CPDD-FO-003 v1.2 (`OfficeFormStep.tsx:187–190`). Still unbuilt and named as such in `fa3f107`'s message: owner's residential address (no column — grep across `web/src`, `api/app`, migrations returns nothing), partners/incorporators (system models one person), semi-annual payment mode (`ApplyWizard.tsx:1520` — `useState<'annual'|'quarterly'>`), Occupancy/FSIC document checklists.

What's left: Owner residential address (decide: account-level, not per filing); partner/incorporator modelling; semi-annual payment mode; per-clearance document checklists.

Risk/Notes: `docs/questions-for-malabon.md` §E1 still reads “we have still never seen” the BPLO counter form and §A19 “We have never seen the paper form” for the amendment sheet — **the doc contradicts the code**, which is transcribed from those very forms with lettered item references. The doc is stale (last touched `816a1b6`, same day); the code wins. Remaining blockers are LGU: A22 (semi-annual authority + due dates), E2/E3, E9.

Item 3 DONE

Checklist: Does line of business really have fixed choices?

Evidence: Closed picklist, no free-text path. `web/src/pages/applicant/ApplyWizard.tsx:784–805` builds options purely from seeded `PsicCode[]`; `:846–851` (`toggle`) only stores a `psic_code_id` from that list. Server side `api/app/Http/Controllers/Api/BusinessController.php:404` enforces `'lines.*.psic_code_id' => ['required', 'exists:psic_codes,id']`. Source of truth `api/database/seeder/ReferenceSeeder.php:63–229`.

What's left: Nothing (answer is “yes, fixed”). Whether the list *contents* are right is questions-for-malabon §A13 — PSIC 2009 list not verified against the PSA.

Risk/Notes: Stale comment at `ApplyWizard.tsx:721–725` still describes the old “Other (not listed)” free-text behaviour, contradicting the code 25 lines below at `:748–763`.

Item 4 DONE

Checklist: GUI issue in zoning — green panel overlapping the form, text bleeding over the map.

Evidence: The symptom is a Leaflet paint-through, fixed at the root. `web/src/components/ui/Proto.tsx:147–173` — overlay is `fixed inset-0 z-[2000] ... transform-gpu bg-black/40`, with a comment naming exactly this bug: *“both showed up as the Leaflet map on the zoning step painting straight through this dialog”* (Leaflet panes sit at z-index 200–1000 and the 3D-transformed tile pane is a compositor layer, so a `z-50` overlay lost the pixels while winning hit-testing). Added in `6386ae5`. Dialog body is `max-h-[70vh] overflow-y-auto (:173)` so long content scrolls instead of bleeding. Adjacent fixes: `88a95c8` raised the trade dropdown above Leaflet's stacking range; `d876853` added `self-start` to the map card (`ApplyWizard.tsx:4459–4473`). “Common Integrated High School” is an OSM tile label — consistent with paint-through, not a stray DOM node.

What's left: Nothing.

Risk/Notes: ⚠ No automated regression guard — `web/e2e/` contains no test that opens the zoning modal (grep for `CONGRATULATIONS / Location insights / Proceed to Application` returns nothing). A future `z-index` or `transform` change would reintroduce this silently.

Item 5 DONE

Checklist: The Mayor's / Business Permit card must not be in the LGU Section grid; Zoning should be.

Evidence: `api/app/Services/ClearanceService.php:56` filters the grid with `->where('code','!=',PermitType::OUTCOME_CODE), and OUTCOME_CODE='BUSINESS'` (`api/app/Models/PermitType.php:19`). `CLEARANCE_ORDER` puts ZONING first (`:59`). **Observed** on the isolated stack: `GET http://127.0.0.1:8081/api/v1/applications/3519/clearances` returns exactly six rows — ZONING, SANITARY, FSIC, CEC, OCCUPANCY, MARKET — no BUSINESS row. **Observed in browser** at `http://127.0.0.1:5199/applications/3519/clearances`: six cards, “Zoning / Locational Clearance · City Planning and Development Office (Zoning)” first, no Mayor's card, no explainer panel. The wizard states why at `ApplyWizard.tsx:3759–3763` — the business permit is attached implicitly at creation (`:2151–2159`), so it is the outcome rather than a choice.

What's left: Nothing.

Item 6 PARTIAL

Checklist: No application form presented once a clearance is clicked; the “choose everything first, then sections expand” shape is wrong.

Evidence: Headline fixed. `ClearanceStagePage.tsx:492–496` — Apply always ends in `if (hasOfficeForm(code)) { onOpenOfficeForm(code) | setFormCode(code) }`, and all six codes have forms (`PermitType.php:50`, `OfficeFormStep.tsx:93–100`). In the wizard the sheet is a step slotted straight behind the cards (`ApplyWizard.tsx:3791–3794`, sequence `:2112–2121`). **Observed:** clicking Apply on Zoning rendered “Application for Locational Clearance (Business Activities) — Form Ref: MCG-CPDD-FO-003 · v1.2” immediately; Apply on Market rendered the Market sheet with “Still needed on this form: Name of Market, Stall No.”. The checklist’s **second sentence is not addressed**. `ApplyWizard.tsx:2097–2104` still derives `selectedOfficeCodes` from which clearances were applied for, and `:2112–2121` inserts one office node per code behind the `clearances` phase — the sections still expand from the choices. Deliberate, and the shipped spec (`docs/clearances-before-payment.md:14–15`).

What’s left: A client decision on what replaces expand-on-selection — the only coherent alternative is BPLO determining clearances from line of business and location, which is `questions-for-malabon.md A1` (line 33). Until answered there is nothing to build.

Risk/Notes: `docs/testing-checklist-status.md:18` marks this “Already fixed”; that covers the first sentence only. The second is ambiguous enough that it should be read back to the tester before anyone restructures the wizard.

Item 7 DONE

Checklist: Chatbot does not work properly.

Evidence: `9f10782` (07-28, on `demo`) rewrote intent matching: scored longest-keyword-hit (`api/app/Services/ChatbotResponder.php:324–351`), per-permit alias table incl. Taglish (`:52–60`), whole-word matching so “market” does not fire inside “marketing” (`:357–362`), fee answers read live `FeeRule` rows instead of the retired `permit_types.base_fee` (`:534–572`). **Verified live** against the tester DB via read-only tinker: “sanitary permit requirements” → seeded CHO checklist; “magkano ang bayad sa sanitary permit” → floor area / employees / unit counts, no peso figure. 43 assertions in `ChatbotTest.php` pass (63/63).

What’s left: Nothing for the reported symptom.

Risk/Notes: △ It is keyword/intent matched, **not LLM-backed** (`ChatbotController.php:15` “no LLM”). Coverage is a closed set: 8 intents, 7 permit aliases, 20 form fields. Anything outside lands on `fallback()` (`:816`) — observed for “where is my permit”, “do i need a barangay clearance”, “how do i cancel my application”, “what happens if my application is rejected”. Honest refusals, not wrong answers, but a tester will read them as “does not work”.

Item 8 PARTIAL

Checklist: Sorting/filter in payment history does not work.

Evidence: Sort and filter are now real, entirely client-side: `web/src/pages/applicant/PaymentsPage.tsx:67-83` (5 sort keys), `:134-143` (status filter + from/to date range), wired into a working menu `:185-197`; the menu renders real `role="option"` buttons at `Proto.tsx:437-510`. Fixed in `3fbc081`. The UTC-vs-Manila date-key bug is handled `:44-65`. **The gap: the page loads one page and only one.** `PaymentsPage.tsx:126` calls `payments.history()` with no params → `resources.ts:508` sends no `per_page` → `PaginatesLists.php:31` defaults to **50 rows**. There is no pagination control, no `meta.total` on screen, no “showing N of M” line. Contrast `applications.list()` (`resources.ts:259-262`), which deliberately asks for the 200-row ceiling *because* its callers filter in the browser; and the officer queue, which reports coverage explicitly (`QueuePage.tsx:94-107`). **Live DB: 1,658 payments; the heaviest applicant holds exactly 50** — sitting precisely on the truncation boundary. No automated test covers payment-history sort/filter.

What's left: Either switch to `payments.historyPage()` (already defined and **unused** at `resources.ts:510`) and render total + paging, or pass `per_page: 200` and state coverage the way `QueuePage` does. Add an e2e case asserting “Oldest first” reorders and a status filter narrows.

Risk/Notes: As written, an applicant with 51+ payments sorts and filters a set the page never tells them is partial — “Amount: high to low” would confidently show the highest of the first 50. **Same class of defect the queue page was already fixed for.**

Item 9 DONE

Checklist: Applicant birthday must be validated; no future dates.

Evidence: Server `api/app/Http/Controllers/Api/OfficeFormController.php:117` — `'form_data.owner_birthday' => ['sometimes', 'nullable', 'date', 'before:today']`, custom message `:123`. Pest `api/tests/Feature/OfficeFormTest.php:214-217` posts `now()->addYear()` and asserts a validation error. Client `web/src/pages/applicant/OfficeFormStep.tsx:804` (`max={todayISO()}`), `:808` `aria-invalid`, `:810-812` inline error, `:195-196` blocks Next. Only one birthday field exists app-wide (CEC/CENRO sheet).

What's left: Nothing.

Risk/Notes: Client and server both reject *today* as well as the future, so the two agree — no silent 422 after a client pass.

Item 10 DONE

Checklist: Verify whether the “Certificate Applied For” FSIC radio list is part of the user side.

Evidence: It **is** applicant-side — section B of the BFP office sheet, `OfficeFormStep.tsx:870-886`, reached from the applicant's LGU Clearances step (`ApplyWizard.tsx:3801-3808`) or `/applications/:id/clearances`. The radio list is **gone**: now a read-only `DerivedField` whose value the API computes at `OfficeFormController.php:286-293` — `'FSIC for Certificate of Occupancy' / 'FSIC for Business Permit (Renewal of Business)' / 'FSIC for Business Permit (New Business)'`, the same three options as the screenshot. **Observed:** after applying for FSIC, GET `/office-forms` returned `FSIC {"certificate_applied_for":"FSIC for Business Permit (New Business)"} . Hint under the field points the applicant at Permit Selection to change it (:884).`

What's left: Nothing.

Risk/Notes: The hint says “you chose in step 1”, but the permit choice is now implicit and clearances are step 6 — the sentence names a step that no longer asks the question. Copy nit.

Item 11 DONE

Checklist: Application dates should be auto-filled once the form is submitted.

Evidence: `api/app/Http/Controllers/Api/OfficeFormController.php:200-204` derives `application_date` on every read and write — `($application->submitted_at ?? now())->toDateString()` — re-applied after every write so a client value is never trusted (`:78-82`, `withDerived` called from `index()` and `upsert()`). Read-only with “auto” tag at `web/src/pages/applicant/OfficeFormStep.tsx:429-446`. Officer side shows same value as “Date of Receipt” (`web/src/pages/officer/ReviewPage.tsx:648`). Test `api/tests/Feature/OfficeFormTest.php:130` passes (79/79, 480 assertions in the filtered run). Commit `ce70a8c`.

What’s left: Nothing.

Item 12 PARTIAL

Checklist: Fields left optional that should be required.

Evidence: The three the handoff names are required on both sides: `BusinessController.php:335` (`registration_type + Rule::in`), `:379` (`registration_number`), `:382` (`tin`), `:403` (`lines min:1`), `:400-402` (`address line1 + barangay_id`). Pest `BusinessValidationTest.php:29, :39`. Client `ApplyWizard.tsx:2310-2320`.
△ GAPS — fields the wizard marks required with a red asterisk but the API accepts as null: - `emergency_contact_name / emergency_contact_number: FieldLabel` required at `ApplyWizard.tsx:4691 / :4708`, gated client-side `:2405-2409`; server rules are `['nullable', ...]` at `BusinessController.php:420-421`. - `economic_organization_others`: required client-side only when “Others” ticked (`:2344-2346`); server is bare `nullable` at `BusinessController.php:428`, no `required_if`. - Per-line capitalization — see Item 35.

What’s left: Add server-side `required / required_with / required_if` for those three so the asterisk means the same at the API boundary as in React.

Risk/Notes: Reachable by any non-browser caller; the wizard is not the only route into `POST /api/v1/businesses`.

Item 13 DONE

Checklist: “Other Requirements” must accept multiple files.

Evidence: `ApplyWizard.tsx:3198-3215` — `handleOtherUpload` appends (`setOtherDocs(d => [...d, ...])`) rather than replacing, in deliberate contrast to `handleUpload` at `:3155-3175` which deletes the previous file for a numbered requirement. UI renders list + “Add another file” (`:4863-4915`). `OTHER` is document type id 11, not a row in `permit_type_requirements`, so it sits outside counted requirements. No unique index on (`application_id`, `document_type_id`); `DocumentController::store` has no per-type replace for non-held docs, so the API accepts N rows.

What’s left: Nothing.

Risk/Notes: Live DB shows zero applications with more than one `OTHER` document — implemented but never exercised by a tester.

Item 14 DONE

Checklist: Drafts are not saved / don't work.

Evidence: Mechanism is **server-side, not localStorage**: a draft is an `applications` row with `status='draft'`, created by `ensureDraftRaw()` (`ApplyWizard.tsx:2717-2737`), updated by a 1200 ms debounced autosave (`AUTOSAVE_DELAY_MS :174`; effect `:3047-3063`). Writes business fields, `title`, `fee_profile`, `payment_mode`, amendment answers, `prior_permit_id`, every touched office sheet (`:2955-3017`). Documents written immediately on upload. Reload survival via `?draft=ID` hydration (`:3264-3430`), restoring documents by document-type code (`:3373-3395`). Live DB: **44 rows** with `status='draft'`; e.g. `applications#3380` created 06:55:32, updated 07:57:36 — an hour of autosaved edits on one draft. `DraftRestoreContractTest.php` + `DraftEditingTest.php` pass.

What's left: Nothing.

Risk/Notes: Two honest gaps, both signposted rather than hidden. (1) A draft cannot exist server-side until `canCreateDraft` is satisfied (`:2918-2952` — permit, name, registration agency, reg number, TIN, ≥ 1 line, address, and for renewal/amendment the prior-permit answer). Everything typed before that lives only in component state; header reads “Not saved yet” and a `beforeunload` handler warns (`:3065-3074`), but a reload at that point loses the typing. (2) `web/src/pages/applicant/DraftsPage.tsx:79-86` renders a trash button with `aria-label="Delete drafts"` and **no** `onClick` — a dead control.

Item 15 DONE

Checklist: No validation for TIN.

Evidence: `BusinessController.php:382` — `['required','string','max:20','regex:/^\d{3}-\d{3}-\d{3}(-\d{3,5})?$/']`, preceded by canonicalisation at `:327-329` → `normalizeTin()` `:534-547` (anything unrecognisable passes through untouched so the regex reports it rather than the normaliser mangling it). Message `:458`. Pest `BusinessValidationTest.php:39,46,60,72` cover required, malformed, separator variants, 9-digit no-branch-code. Client mirror `ApplyWizard.tsx:618-623` `tinValid()`, gated `:2318-2319`.

What's left: Nothing.

Risk/Notes: Regex checks shape only, not the BIR check digit — deliberate looseness.

Item 16 PARTIAL

Checklist: Date Issued should be auto-generated through the admin side.

Evidence: The two fields are off the applicant's form entirely — server-enforced: `OfficeFormController.php:39` `OFFICER_KEYS = ['building_permit_date','fsec_date','date_issued']`, stripped from an owner write, writable only by a reviewer scoped to that filing and sheet (`:73-99`). Tests `OfficeFormTest.php:144/:158/:196` pass. But on the admin side they are still **manual** `<input type="date" max={todayISO()}>` pickers, not generated: `ReviewPage.tsx:81-87` (`OFFICER_DATE_FIELDS`) rendered `:1324-1370` with a “Save dates” button. Genuine auto-generation exists only for BizTrack's own issuance: `api/app/Services/WorkflowService.php:346` sets `'issued_at' => now()`.

What's left: Confirm with BPLO/OBO/BFP what “auto-generated” means for a Building Permit / FSEC that a *different* office issued on paper.

Risk/Notes: These dates record when OBO and BFP released external documents. BizTrack holds no record of those events, so it **cannot compute them** — effectively BLOCKED (LGU) unless the tester meant only “the admin fills them, not the applicant”, in which case DONE.

Item 17 DONE

Checklist: Next must not be clickable until all required fields are entered.

Evidence: `ApplyWizard.tsx:5096-5102` — `disabled={saving || stepMissing.length > 0}`; `:5122-5126` names what is missing. `stepMissing` from `missingFor(node)` at `:2463`, covering every phase (`:2229-2439`) and every office sheet via `officeFormMissing` (`OfficeFormStep.tsx:181-227`). Belt-and-braces: `next()` returns early at `:2870`, and `jumpBlocked` (`:2485-2489`) stops the section map hopping over an unfinished step. **Observed live** at `http://127.0.0.1:5199/apply?type=new`: Next rendered `[disabled]` with “Still needed on this part: Your agreement to the Data Privacy Consent”. Covered by `apply-wizard.spec.ts:70-81`.

What's left: Nothing.

Risk/Notes: Submit on the last step gates only on `consent` (`:5106`), not `stepMissing` — safe only because `jumpBlocked` prevents reaching Review with an incomplete earlier step. If that guard is loosened, Submit becomes reachable with gaps.

Item 18 BLOCKED (LGU)

Checklist: Revenue-code section numbers must not be mentioned.

Evidence: On the record as **A12** — `questions-for-malabon.md:282-293`, “May the Revenue Code section numbers be shown to applicants? ... Confirm that is final.” Current behaviour: citations hidden from applicants, kept for officers. `web/src/components/TaxOrderBreakdown.tsx:33-35,49` builds “Sec. 3A.02 · A10-2016” only when `showCitations` is true; the prop defaults to `false` (`:58`) and all three applicant call sites pass nothing (`PayPage.tsx:139`, `ApplicationDetailPage.tsx:193`, `PaymentsPage.tsx:107`). Only

`officer/ReviewPage.tsx:1383` passes it. Server-side `ApplicationResource.php:131-143` strips `section / source` for anyone without `application.review`. **ONE REAL LEAK, independent of the LGU**

decision: `PaymentController::fee` (`PaymentController.php:44-49`) returns `$fee->line_items` **raw**, bypassing `ApplicationResource`. That is exactly the endpoint the applicant's Pay page calls (`PayPage.tsx:34` → `resources.ts:505` → `GET /applications/{id}/fee`). Verified against the live DB: every stored line carries `code, label, amount, office, group, section, source, requires_officer, defects` (e.g. `"section": "Sec. 3A.02", "source": "A10-2016"`, 6/6 lines on the newest assessment). So `docs/api-contract.md:157-161`'s guarantee — “*hiding them only in the UI would leave them in the network tab, so the filtering is in ApplicationResource*” — **does not hold on this route**.

What's left: (1) Get A12 answered by BPLO. (2) Regardless of the answer, route `PaymentController::fee` through the same stripping, or the API contract's claim is false.

Risk/Notes: Both sides plainly. *For removing:* the LGU asked; a bill quoting ordinance sections reads as legalistic and invites counter arguments BPLO does not want the software to start. *For keeping:* ₱660 with no authority behind it is a number a business owner cannot check. The citations are the only mechanism by which an applicant can confirm they are being charged lawfully — and **this system computes fees automatically from a transcribed ordinance, so it is precisely where a silent error would hide**. A middle path exists and is not built: keep the ordinance name in the footer (already there for officers, `TaxOrderBreakdown.tsx:126-130`) and drop the per-line section numbers.

Item 19 DONE

Checklist: Admin-side Other Requirements page is locked.

Evidence: All eight staff roles hold `request.create` (DB `role_permissions` : admin, bplo_staff, sanitary, fire, zoning, obo, cenro, market all YES; only `business_owner` lacks it). Nav item at `web/src/lib/nav.ts:57`. Page fully interactive for staff: compose opens `RequestsPage.tsx:622-628`, close actions `:305-318`. **Live against :5199:** `GET /api/v1/requests` → 200 for sanitary (38 rows), bplo (125), market (0).

What's left: Nothing.

Item 20 DONE

Checklist: The application form did not reflect on the admin side.

Evidence: `officer/ReviewPage.tsx:452` loads `assignments.get(assignmentId)`; Sections A–E render the applicant's own answers — `business/registration` :980–1075, `lines of business` :1078–1110, `documents` :1113–1126, `office-form answers` :1129–1165, `fee declaration` :1168–1220. **Live** `GET /assignments/15` as sanitary returned 13.4 KB carrying `business` (with `lines`), `documents` (9), `office_forms` (4), `fee_profile`, `permit_types`, `status_history`.

What's left: Nothing.

Item 21 PARTIAL

Checklist: Add session-hijacking protection (marked optional).

Risk/Notes: Marked optional; not a gate for the demo. Existing rate limiting + 12 h expiry + real server-side revocation exceed what a prototype usually carries. The one thing to say plainly to the panel: **the token lives in localStorage and is therefore readable by any injected script** — state it rather than gloss it.

Item 22 DONE

Checklist: Fix the notification empty-state description on the admin side.

Evidence: `web/src/pages/NotificationsPage.tsx:150-159` — `emptyStateFor(user)` branches on permission: `user.manage` → “System alerts, officer assignments, and escalations will show up here.”; `application.review` → “Applications routed to your office, applicant replies, and inspection updates...”; otherwise the applicant copy. Rendered :224. Landed 887fc4a (07-28, on demo).

What's left: Nothing for the copy.

Risk/Notes: ⚠ The copy is now role-correct but still not *true* for the super admin: `admin@biztrack.local` (the only account holding `user.manage`) has 1 notification in 20,524 rows. Nothing in `NotificationService.php` pushes “system alerts, officer assignments, or escalations” to an admin. The page will keep showing this empty state indefinitely, now promising news that is never sent.

Item 23 DONE

Checklist: Application must not ask what type of form (renewal / new).

Evidence: Type comes from the entry URL, never a question: `ApplyWizard.tsx:1515-1523` (`searchParams.get('type')`) and `:3297` (`setApplicationType(app.application_type)` on draft reopen). Dashboard entry points are links, observed live: `/apply?type=new`, `?type=renewal`, `?type=amendment`. On all four office sheets that print it, it is a read-only `DerivedField` with a “from application” tag — `OfficeFormStep.tsx:529-537` (Zoning), `:702-711` (Sanitary), `:779-788` (CEC), `:1016-1024` (Market).

What's left: Nothing.

Risk/Notes: `OfficeFormStep.tsx:907-914` renders an *editable* control labelled “Application Type” on the Occupancy sheet — but its options are `OCCUPANCY_SCOPES = ['Full', 'Partial']` (`:471`), i.e. how much of the building is occupied, a genuinely different question. The label collides with the one item 23 complained about and will read as a regression to the next tester; consider “Scope of Occupancy”.

Item 24 DONE

Checklist: Admin/super-admin login should be a different page/session.

Evidence: Commit `ea2765c`. Two token keys — `tokenKeyFor()` returns `biztrack.token.${portal}` (`web/src/lib/api.ts:45-47`). Two routes: `/login` (`App.tsx:111-114`) and `/staff/login` (`:120-123`). **Enforced server-side, not just UI:** `AuthController.php:168-175` rejects the mismatch. **Live:** staff creds on the citizen portal → **409**; owner creds with `portal=staff` → **409**. Token name records the door used (`:64`).

What's left: Nothing.

Risk/Notes: The two pages are one component (`LoginPage`) with a `portal` prop and one shared `POST /auth/login` endpoint — separation is real at the session/token/route layer, not the component layer. Satisfies the checklist; worth knowing before someone “hardens” it further.

Item 25 DONE

Checklist: The Download Receipt does not work.

Evidence: Verified independently, not on the handoff's word. - Route `api/routes/workflow.php:135`; handler `PaymentController::receipt` (`:132-171`), authorised via `ApplicationVisibility::canView` (`:139-143`). - Double-render corruption fixed structurally: `api/app/Support/PdfFile.php:26-29` renders **once** and hands the same bytes to both the archive copy and the download. - Frontend button `PaymentsPage.tsx:260-268`, call `:150-160`, error surfaced `:214-218`. Download goes through `downloadBlob` → `rethrowBlobError`, so the §8.4 family is handled. - **Tests are byte-real, not `UploadedFile::fake()` (§10.4):** `PdfDownloadTest.php:67-88` asserts `%PDF-`, `%%EOF`, 0 broken `FlateDecode` streams, exactly 1 parsed page, extracted text, and that the archived file is byte-identical. **Ran it: 3 passed, 26 assertions** (in-memory SQLite; tester DB untouched). - **Also rendered a receipt from live payment 3320 / PAY-2026-000465 read-only** (write-guard installed on the PDO listener): 879,487 bytes, `%PDF-1.7`, 1 page, correct reference / tracking ID / business / method / total **₱8,798.50**.

What's left: Nothing for the reported defect.

Risk/Notes: Two adjacent findings. (1) `△` The receipt download exists **only** on the applicant's Payment History — there is **no receipt button anywhere on the officer/admin side** (`grep payments.receipt` returns exactly one call site), even though `PaymentController::receipt` deliberately admits officers per item 56; and the paid-success screen on `PayPage` has no download either, so a just-paid applicant must navigate away to get one. (2) `PaymentController::receipt:164-168` performs a **DB write (`receipt_path`) on a GET** — harmless today, but “view a receipt” is not a safe/idempotent request.

Item 26 PARTIAL

Checklist: Contact-number validation message should be more specific.

Evidence: The screenshot's exact string was removed by 0e9b18e (07-29, body names item 26).

web/src/lib/validation.ts:32-50 now diagnoses the fault: wrong prefix → :44 ; wrong length → :46-48 "That number is N digits long, but a mobile number needs 11."; non-digits → :39 . Used at RegisterPage.tsx:63 . △

TWO REAL GAPS: 1. **No server-side rule at all.** AuthController.php:83 and :225 are

['required','string','max:20'] . **Observed** against the isolated API: POST /api/v1/auth/register with

"mobile_number":"000000000000" returned 422 naming only email , password , data_privacy_consent — **no**

mobile_number error. The screenshot's own input passes the API. 2. **The wizard's phone fields never got the**

item-26 treatment. ApplyWizard.tsx:641-642 uses one flat PHONE_ERROR ("Enter a Philippine mobile or landline

number, like 09171234567 or 8123 4567.") for telephone, lessor contact and emergency contact — a format

restatement, exactly what item 26 objected to. phoneValid() at :632-639 only counts 7-13 digits, so

00000000000 is **accepted**.

What's left: Add a PH mobile regex to AuthController register/profile-update; replace the wizard's flat

PHONE_ERROR with defect-naming messages (reuse validateMobile); tighten phoneValid to refuse all-zeros.

Risk/Notes: Tightening phoneValid will also refuse landlines unless mobile and landline branches are separated — the current looseness is what lets 8123 4567 through.

Item 27 DONE

Checklist: Password reveal control disappears when focus moves to another field.

Evidence: web/src/components/ui/PasswordInput.tsx — permanent <button> toggle rendered unconditionally

(:53-62 , aria-label flips Show/Hide, aria-pressed set), with the browser's own focus-dependent control

suppressed via [&::-ms-reveal]:hidden (:49). The docblock (:5-12) names the symptom and cause: testers

were seeing Edge's native ::-ms-reveal , focus-gated by design, because the app had no toggle of its own. Fixed

in 0e9b18e . Used at LoginPage.tsx:239 , RegisterPage.tsx:317 / :328 , ResetPasswordPage.tsx:40 ,

SettingsPage.tsx:390,406,420 .

What's left: △ One field still uses a raw input with no toggle: web/src/pages/admin/UsersPage.tsx:611-615 , the

"Temporary password" field in the admin create-officer form. It will show Edge's native focus-gated reveal — the

exact original bug, on a staff-only screen. Swap for <PasswordInput> (one line, already exported).

Risk/Notes: Low. Admin-only screen seen by MISD, not applicants, so it did not surface in tester rounds.

Item 28 **BLOCKED** (LGU)

Checklist: Will the email/SMS notification consent be integrated?

Evidence: Three facts: 1. **The checkbox is decorative.** RegisterPage.tsx:126 — /* Prototype's second checkbox row — notification consent (visual, not part of the API payload). */, rendered :367–375. The registration payload :174–177 sends only data_privacy_consent. There is **no** notification-consent column: migrations carry only data_privacy_consent_at (create_users_table.php:30). Ticking or unticking it changes nothing, anywhere. 2. **Nothing is delivered.** NotificationService::fanOut() (:255–265) sends to every user unconditionally — never consults consent. Mail → api/config/mail.php:17 env('MAIL_MAILER','log'), i.e. laravel.log. SMS → SmsChannel, bound in AppServiceProvider.php:20–24 by a match whose **only arm is default** => new LogSmsChannel — there is literally no second driver to select, whatever SMS_DRIVER says. LogSmsChannel::send() writes storage/logs/sms.log. runbook-deploy.md:19 sets MAIL_MAILER=log SMS_DRIVER=log even for deployment. 3. **The dependency is the city's.** questions-for-malabon.md **\$B4** — “Nothing is delivered today. Email is written to a log file and SMS to a file called sms.log. No applicant has ever received a message from this system.” Asks MISD for: an existing city SMS provider, an official city SMTP/sending domain (“a permit notice from a Gmail address will be read as a scam”), and who owns sending reputation for a bulk renewal run.

What's left: Two tracks; the second must not wait on the first. - *Ours, unblocked today:* persist the consent answer (add notification_consent_at + accept it in register), and gate fanOut() on it. Otherwise the checkbox is a consent UI that collects nothing — worse than not asking, given the RA 10173 framing on the same page. - *Theirs, blocked:* MISD must answer B4. Implementation is then ~a day: a TwilioSmsChannel / SemaphoreSmsChannel implementing App\Services\Sms\SmsChannel (one method), a new match arm, and MAIL_MAILER=smtp + credentials in api/.env (permission-blocked).

Risk/Notes: The abstraction is genuinely clean — SmsChannel is a one-method interface with no call-site coupling — so “swappable later” holds. But every renewal reminder, approval notice and document request in NotificationService is **silent today**, and the tester-facing checkbox implies otherwise. Say so to the panel rather than letting the checkbox speak.

Item 29 **SUPERSEDED** (by the item 99 fix — and the answer is: no, because nothing enforces it)

Checklist: If email consent/verification is not given, does it matter?

Evidence: Email verification is **advertised, never enforced**. Nothing applies Laravel's `verified` middleware: `api/bootstrap/app.php:18-20` aliases only `permission`; the authenticated group at `api/routes/api.php:19` is `auth:sanctum` alone; and `POST applications/{application}/submit` (`api/routes/workflow.php:73`) carries no verification gate. Grep finds `email_verified_at` in exactly five places, all read-or-write, none a guard: `User.php:20,29`, `UserResource.php:28`, `AuthController.php:348-349`, `Admin/UserController.php:94`. The `verify` endpoint works — `verifyEmail()` `:333-353` does `hash_equals(sha1($user->email), $hash)` and stamps `email_verified_at`. But `△ resendVerification()` **at :355-359 is a stub**: `// Verification is simulated for the prototype (no live SMTP required); it returns {"message":"Verification email sent."}` and **sends nothing**. `register()` (`:74-113`) also dispatches no verification mail. So no self-registered user has ever received a verification link, and none can become verified by their own action.

What's left: Decide with BPLO whether verification should *become* a gate. If yes: make `resendVerification` actually mail a signed link (blocked on B4, same as item 28), gate the one action that needs it (`ApplicationController::submit`), and show the reason *at that action*, not app-wide. If no: delete `resendVerification / verifyEmail` and the Profile “Verified” line (`ProfilePage.tsx:442-443`) rather than leaving a capability that can never complete.

Risk/Notes: `△ The conflict with item 99 resolves cleanly`: because verification is *not* enforced, removing the banner removed a false claim and created **no wall** — an unverified applicant can register, file and submit today with no obstruction. The risk the question probed is the inverse of what it assumed. What IS broken is smaller but real: `POST /auth/email/resend` lies to the caller, and `/verify-email` plus Profile's verified badge are dead ends for self-registered users. If verification is ever made a gate, item 99's banner removal must be revisited **in the same commit**, or users hit a blocked submit with nothing explaining why.

Item 30 **DONE**

Checklist: Remove the long blue explanatory paragraph on the “Title of Application” step header.

Evidence: Removed in `df77f8c` (07-29), message states “the step-map paragraph and the Mayor's Permit explainer are gone (30, 31)”; diff drops the `<p className="mb-5 text-xs text-ink-secondary">` block and the “Title of Application” label. Current header chrome is title input + save indicator + Clear All only (`ApplyWizard.tsx:3651-3703`), then the section map (`:3706-3747`) — no prose. Observed live. Residual “Title of Application” placeholder killed later in `88a95c8`.

What's left: Nothing.

Item 31 **DONE**

Checklist: Remove the “You are applying for the Mayor's / Business Permit ...” description.

Evidence: `git log -S "always included"` — block deleted in `df77f8c` (07-29). String absent from `web/src` today. The clearances step now renders heading + rule only (`ApplyWizard.tsx:3755-3758`), with the rationale kept as a source comment (`:3759-3768`) rather than on screen.

What's left: Nothing.

Item 32 DONE

Checklist: Drafts must autosave; remove the “Save draft” button and helper text.

Evidence: `grep -rn "Save draft|Save Draft|save draft" web/src e2e api/app` returns exactly one hit — the comment at `ApplyWizard.tsx:3043` “Autosave (there is no Save draft button)”. The helper sentence from the screenshot is gone (no match in `web/src`). Header carries a state indicator instead (:3682–3695): “Saving...” / “All Changes Saved” / “Unsaved changes” / “Not saved yet”, driven by `dirty` so it can never claim more than happened. Remaining footer buttons are “Next” (:5101) and “Save & back to clearances” (:5093) — navigation, not draft-saving. Every Next/section jump flushes via `persistOnLeave()` (:2767–2817).

What’s left: Nothing.

Item 33 PARTIAL

Checklist: Zoning is misplaced; should be the first step.

Evidence: `ApplyWizard.tsx:138–146` — `BASE_PHASES = ['privacy', 'address', 'business', 'documents', 'fees', 'clearances', 'review']`. Location & Zoning is **Part 2**, not Part 1; Data Privacy Consent is Part 1. Zoning-first landed in `df77f8c` (07-29), then `d223167` (08-02) prepended the consent gate for item 71. Reasoning at :112–119.

What’s left: Nothing, unless the LGU insists Zoning be literally screen 1 — that would require moving the RA 10173 consent to the end.

Risk/Notes: ⚠ **Directly contradicts item 71.** Item 33 (~29 Jul round) wants Zoning first; item 71 (Aug 2 round, `docs/testing-checklist-aug2.md:26`) wants Data Privacy Consent “first or last”. Both cannot be first. Current build honours 71 as the later instruction and makes Zoning the first *data-collection* step. Flag to the client rather than silently reorder.

Item 34 SUPERSEDED

Checklist: The 11-step flow order is incorrect.

Evidence: None of that order survives. Current sequence (`ApplyWizard.tsx:138–146` , :2112–2121 ; observed live “Part 1 of 7”): 1. Data Privacy Consent 2. Location & Zoning (Line of Business asked here) 3. Business Information 4. Documentary Requirements 5. Business & Tax Profile 6. LGU Clearances — each applied-for clearance’s sheet inserted immediately after (:2116–2118) 7. Review & Submit The screenshot’s “Permits & Certificates” step was renamed and moved to position 6 (`f5f4428` diff shows `permits: 'Permits & Certificates'` deleted); standalone office-form steps 5-8 became inline sheets; “Line of Business” deleted. Superseded by items 76, 33, 69, 71 and the 4 Aug decision in `docs/clearances-before-payment.md` (`ApplyWizard.tsx:79–136` records the argument).

What’s left: Nothing — but the order must be re-confirmed with the client against the current 7 parts, not the 11 in the screenshot.

Risk/Notes: Contradicts item 69’s screenshot too. **Three checklist rounds each show a different intended order.**

Item 35 PARTIAL

Checklist: Capital needs thousands separators and must be required.

Evidence: Comma formatting DONE — `FeeProfileStep.tsx:210–219` `formatAmountInput()` groups thousands, caps two decimals, wired as-you-type via `NumberField :729 / :743`. Field is `label="Capitalization (P)" :1006` with `required :1007`. Required is **client only**: `:322–336` `numericIssue({required:true, positive:true, ...})` gated for new filings, surfaced through `feeProfileMissing()` (`:631–639`), consumed by `ApplyWizard.tsx:2432`. `⚠` Server does NOT require it: `ApplicationController.php:587` — `'fee_profile.lines.*.capitalization' => $money where $money = ['nullable','numeric','min:0','max:10000000000'] (:543)`. `submit()` `:239–278` adds no capital check; `syncLineCapitalization()` (`:328`) skips lines without the key. `BusinessController.php:405` likewise nullable.

What's left: Enforce at the server submit boundary for `application_type = new` (same place items 82/84 are enforced, `ApplicationController.php:255–262`).

Risk/Notes: Rules can't simply flip to `required` in `feeProfileRules()` — drafts autosave half-typed, which is why everything there is nullable. Submit-time is the correct hook.

Item 36 DONE

Checklist: Allow renaming of drafts.

Evidence: Column added by `2026_07_29_000010_add_title_to_applications.php` (comment cites item 36). Editable input in wizard header, `maxLength=120`, sr-only label (`ApplyWizard.tsx:3666–3680`); auto-generates from type + business name until typed, then `titleEdited` stops the generator (`:1583–1625`, `:3299–3303`). Persisted on create (`:2729`) and every autosave (`:2986`). Drafts list reads `d.title?.trim() || d.business?.name || 'My Application'` (`DraftsPage.tsx:118`). Tests `DraftEditingTest.php:42/:58/:79` pass. Live DB: 7 of 44 drafts carry titles, e.g. `#3388 "New Business Permit – Uno Mini Mart"`.

What's left: Nothing.

Risk/Notes: Renaming happens inside the wizard, not in place on the Drafts page. The pencil glyph on each card (`DraftsPage.tsx:25–43`, `:134`) is `aria-hidden` decoration inside the card's `<Link>` — signals “editable” but is not a rename affordance. If the tester expected in-place rename, small residual.

Item 37 DONE

Checklist: Chatbot answered a form-field question with a canned permit menu.

Evidence: `a2a36de` (07-29, on `demo`) added a field layer running *ahead* of the permit intents (`ChatbotResponder.php:299–304`, `fieldAnswer()` `:401–418`, `FIELD_RULES :107–256`). **Ran the tester's exact sentence** read-only against the live DB: “In the sanitary permit application, what is the water source for?” → “Water Source is on the Sanitary Permit sheet, under Establishment Sanitation Profile... Pick one: Level III (Waterworks), Deep Well, Bottled / Refill, or Other.” The screenshot's canned menu is `permitMenu()` (`:786`), now only reached when a permit is named with no question (verified: bare “sanitary permit” still returns the menu, correctly). Tests `ChatbotTest.php:305–380`.

What's left: Nothing.

Risk/Notes: An unknown field gets an explicit “I do not have a note on that field, and I would rather not guess” (`:455–463`) rather than an invented definition — deliberate.

Item 38 DONE

Checklist: Only Barangay and House No./Street are validated; other zoning fields should be too.

Evidence: `ApplyWizard.tsx:2349–2411` — the `address` step's blocking list now covers Line of Business (:2359), non-Other PSIC (:2368–2371), House No. & Street (:2379), Barangay (:2380), a map pin (:2383), the pin being inside Malabon (:2390), lessor name/address/monthly rental when rented (:2394–2400), lessor contact format (:2401), Emergency Contact Person + Number with format (:2406–2410). Per-field inline errors for each in `fieldErrors` (:2539 onward), rendered with `aria-invalid + text-s-red` at :4532, :4552, :4619, :4641, :4661, :4680, :4703, :4722. LOB and pin get their own required messages at :4450–4455 and :4500–4507. API mirrors the rented trio with `required_if`.

What's left: Nothing.

Risk/Notes: One field deliberately unvalidated — “Locational Group/Landmark” (:4556–4566), optional free text. If the tester meant that one, it is a deliberate choice.

Item 39 DONE

Checklist: Validation on the Business & Tax Profile inputs.

Evidence: Item text confirmed from `docs/checklist-round2-plan.md:35`. Client `FeeProfileStep.tsx:271–274` (comment cites item 39) → `feeProfileIssues()` runs `numericIssue()` (:250–263) over every money and count field: non-numeric, negative, non-integer, zero-where-meaningless, ceiling checks, all surfaced as one list so the applicant does not discover a second class of error after fixing the first. Keystroke filtering :210 / :222. Server mirror `ApplicationController.php:530–620` `feeProfileRules()` — docblock :537 names item 39 — with ranges, a 16 KB payload cap (:555), two cross-field rules (:566 `split-fits-total`; :596 `employees-in-LGU ≤ total`).

What's left: Nothing for “proper inputs” as scoped. Requiredness is a separate gap — Item 35.

Item 40 DONE

Checklist: Profile menu entry lands on Settings instead of a Profile page.

Evidence: `web/src/components/AppShell.tsx:130–132` — the account menu is `{label:'Settings', to: portalPath(portal, '/settings')}` then `{label:'Profile', to: portalPath(portal, '/profile')}`; separate targets. `web/src/App.tsx:192–193` mounts `/profile → ProfilePage` and `/settings → SettingsPage` (staff mirrors :223–224). **Observed at :5199:** avatar menu shows `menuItem Settings / Profile / Log Out`; clicking Profile navigated to `/profile` and rendered heading “Profile” with account-details card and Approved Businesses — not Settings.

What's left: Nothing.

Item 41 DONE

Checklist: Chatbot does not show earlier messages after a reload.

Evidence: Persistence is server-side, three parts: (1) `ChatbotMessage` rows for both turns written in one transaction (`ChatbotController.php:69–83`); (2) one conversation per user enforced by a unique index — confirmed present in the live tester DB (`chatbot_conversations_user_id_unique` ; 3 conversations, 0 duplicated user_ids, 38 messages); (3) the panel loads `/chatbot/messages` **on mount**, merges by message id instead of replacing, and leaves `loaded` `false` on failure so the next open retries (`web/src/components/ChatBubble.tsx:88–112` , `mergeThread` :29–32). The `a2a36de` body names the two real causes (wholesale state replacement + `loaded` `latched` on a failed GET). Tests `ChatbotTest.php:382–451` .

What's left: Nothing.

Risk/Notes: History windowed to the last 200 turns (`ChatbotController.php:24`); no thread is near that.

Item 42 DONE

Checklist: The wrong-portal message box persists after clicking “Go there now”.

Evidence: Two independent mechanisms: 1. **The link is a real navigation.** `LoginPage.tsx:188–192` renders `<a href={loginPathFor(staff ? 'public' : 'staff')}>Go there now.</a>` — a plain anchor, not a `<Link>` , with a comment :180–186 explaining why (portal split `ea2765c` ; HANDOFF §8.1: crossing between the two sites must be a real navigation). A full document load remounts the SPA, so `formError` / `wrongPortal` cannot survive. 2. **Belt and braces for client-side hops.** `LoginPage.tsx:62–69` — a `useEffect` keyed on `location.pathname` clearing `formError` , `wrongPortal` , `sessionExpired` , `errors` whenever the path changes. Covers the footer route (:155–158 , a router push). Root cause documented in `0e9b18e` : “*/login and /staff/login render the same component at the same position in the route tree, so React reconciled instead of remounting.*”

What's left: Nothing for the reported defect. Two loose ends: - `△` The `0e9b18e` message and the comment at `LoginPage.tsx:59–61` both promise “*The typed credentials stay: the whole point of ‘Go there now.’ is that they were right, just at the wrong door.*” That was true when the fix was a client-side reconcile; it stopped being true when `ea2765c` made the link an `<a href>` . A full page load clears `email` and `password` . **The comment is now stale and the intended UX is silently no longer delivered.** - No automated coverage of the actual complaint. `web/e2e/auth.spec.ts:46–87` asserts only the API's 409 and its `portal` field; no test clicks “Go there now.” and asserts the alert is gone.

Risk/Notes: Because the fix rests on a full navigation, any change back to `<Link>` would silently regress this item and break the portal session model. The comment at :180–186 is the only guard — worth the e2e test.

Item 43 DONE

Checklist: Messaging shows no distinction between sender and receiver.

Evidence: `web/src/components/MessagesPanel.tsx:186–187` — `isMine` compares `message.sender.id === user.id` , replacing the old side-of-the-house test that mislabelled the super admin (who has no department) as inbound. `Bubble` (:116–159) differentiates on three channels, not colour alone: alignment (`justify-end` / `justify-start`), fill (`bg-royal text-white` vs `border-line bg-white`), attribution (“You” vs avatar + sender name + “· Officer”/“· Applicant”). One component serves both portals so the two sides mirror. Commit `c2a1b87` (07-29, on `demo`).

What's left: Nothing.

Risk/Notes: No e2e coverage — `web/e2e/` has no messaging spec. Verified by code, not a driven browser.

Item 44 PARTIAL

Checklist: Approved applications still listed; should now be in the profile.

Evidence: Applicant side done: `ApplicationsPage.tsx:42` `const FINISHED: ApplicationStatus[] = ['approved', 'issued']`, `applied :369` (`inPlay = submitted.filter(a => !FINISHED.includes(a.status))`), with a “N approved applications are now in your Profile” pointer `:417–431` and approved/issued removed from the status filter (`:80–88`). Comment `:29–32` names item 44. **Officer side — which is what the screenshot shows** (“Application Verification” = `web/src/pages/officer/QueuePage.tsx:387`, route `/staff/queue`) — still lists approved rows **on purpose**: `QueuePage.tsx:43` `INSPECTION_STATUSES = ['for_inspection', 'approved', 'issued']`, and `:64–66` states “For Inspection is deliberately unfiltered — an inspector needs the approved filings to still be there.” The For Approval tab does exclude them (`:40`).

What’s left: Confirm with the tester which tab the screenshot was taken on. If approved rows must also leave For Inspection, drop `approved / issued` from `INSPECTION_STATUSES` or move them behind a “Completed” tab; if the inspector genuinely needs them, record as wontfix. **An officer’s queue cannot literally “go to the profile” — an applicant’s Profile is not visible to LGU staff.**

Risk/Notes: The dev attributed item 44 to the applicant Track page (`ApplicationsPage.tsx:31`); the screenshot is admin-side, so the two readings diverge.

Item 45 DONE

Checklist: Enter should send a message, not only the Send button.

Evidence: `MessagesPanel.tsx:276–283` — `onKeyDown` sends on Enter, returns early on `e.shiftKey` (newline) and on `e.nativeEvent.isComposing` (so an IME candidate commit is never swallowed — relevant for Filipino/CJK input). Send button remains `:304–311`; behaviour announced at `:313–315` (“Press Enter to send. Shift + Enter starts a new line.”) wired via `aria-describedby`. Same commit `c2a1b87`.

What’s left: Nothing.

Risk/Notes: Chatbot panel gets Enter for free — a real `<form>` with `type="submit"` (`ChatBubble.tsx:213,225`).

Item 46 PARTIAL

Checklist: Applications marked as checked has bugs (11-step chip row).

Evidence: The chip row is the apply-wizard section map, `ApplyWizard.tsx:3706–3745` (labels `:148–165`). The tick is **derived, not stored**: `const done = opened && stepComplete[i]` at `:3716`, intent stated `:3713–3715` and `:3397–3404` (“a draft saved with no documents uploaded shows Documentary Requirements unticked, which is the truth about it”). Re-derived every render from the answers, so it cannot go stale across reloads.

What’s left: The tester’s specific defect is **not reproducible from the code** — the derivation reads correct. Needs a repro (which chip, what state) or should be closed as fixed by the rewrite. Separately: the chips use `disabled={!opened || blocked || current}` at `:3722`, which **violates the project’s own WCAG rule** (HANDOFF §8.5, “Never disabled” — use `readOnly + aria-disabled`).

Risk/Notes: Applicant-side surface, not admin-side; landed in this batch by number only.

Item 47 DONE

Checklist: Add a remove button to attached files.

Evidence: `handleRemoveDocument` at `ApplyWizard.tsx:3219-3242` deletes server-side first (“a file that disappears from the screen but stays in the record is not removed, it is hidden”) then updates state. Labelled Remove button per numbered requirement (:4845-4855 , `aria-label={ Remove ${dt.name} }`) and per Other row (:4890-4899), with “Removing...” busy state. Backed by `DELETE /applications/{application}/documents/{document}` → `ApplicationController::destroyDocument` (`api/routes/workflow.php:106`). Held clearance copies have their own remove control (`ClearanceStagePage.tsx:508-514, 886-890`). Tests `DraftEditingTest.php:159/:175/:188/:201` pass.

What's left: Nothing.

Item 48 DONE

Checklist: The downloaded receipt renders as a near-blank page with stray rules.

Evidence: Root cause documented and fixed at the mechanism, not the symptom: `PdfFile.php:10-29` — dompdf’s CPDF backend mutates its object table while writing, so a second `->output()` re-deflates already-deflated font programs; laravel-dompdf guards `render()` but not `output()` . `PaymentController.php:161-162` now renders once through `PdfFile::render` . Fixed in `ac4e288` .

What's left: Nothing for the reported defect.

Risk/Notes: ⚠ **One content defect the rendered page exposes: officer-pending lines print as 0.00** . On the live receipt, “Public market stall rental” shows `0.00` because it is a `requires_officer` placeholder awaiting the City Market Administrator’s figure. The web breakdown deliberately renders these as `-` with an “Officer assessment” chip (`TaxOrderBreakdown.tsx:38,44-51`) precisely because **a bill claiming a fee is zero when it is merely unset is a lie** — and `PaymentsPage.tsx:99-105` says that was fixed on screen for exactly this reason. **The PDF never got the same treatment**. Worth fixing before the LGU sees a receipt.

Item 49 DONE

Checklist: Messaging has no dedicated page; follow the revised GUI.

Evidence: `web/src/pages/MessagesPage.tsx` (336 lines) — two-pane inbox: searchable/sortable conversation list plus open thread behind the light-blue name bar, built to “revised GUI screens 8-10 applicant, 101-102 staff” (:12-26). Routed in **both** portals: `web/src/App.tsx:190` (`/messages`) and `:221` (`/staff/messages`), and in the rail for both via `web/src/lib/nav.ts:50` gated on `message.participate` — held by all 9 roles per the live DB. Backed by `MessageController::threads()` (:111-236), paginated and office-scoped; 6 tests in `MessageThreadsTest.php` pass. In-application panel and page share one `MessageThreadView` .

What's left: Nothing.

Item 50 DONE

Checklist: Renewal must offer a choice of which specific business permit to renew.

Evidence: `ApplyWizard.tsx:1302` renders a modal titled `WHICH PERMIT ARE YOU RENEWING?`; `:1318` asks “Which business are you renewing?” (select), `:1346` asks “Which permit are you renewing?” as a `role="radiogroup"` (`:1368–1370`) listing that business’s renewable permits with permit number, type and validity dates (`:1410–1422`). Persisted at `PriorPermitController.php:53,62` (`prior_permit_id` validated `present|nullable|exists:permits,id,ownership-checked :57–59`, audited `:64`). Commit `26b5e96` (08-05), `+1122/-214`, with `web/e2e/renewal-modal.spec.ts`.

What’s left: Nothing.

Item 51 DONE

Checklist: Accepted applications are not notified.

Evidence: `api/app/Services/NotificationService.php:62–78` — `applicationApproved()`, comment marks it “tester item 51”; pushes a decision notification to `$app->applicant` linked to `/permits`, plus `permitsIssued()` `:98–112`. Called from `WorkflowService::approveAndIssue()` (`:354`), reached from the office-approval progression at `:231` and `:282`. Intermediate acceptances covered by `applicationStatus()` (`:41–60`), which deliberately suppresses the two end states so the applicant is not told twice. **Live DB: 1,489 “Application approved” notifications; of 1,491 approved applications only 2 lack one** (ids 1 and 3, decided 2026-07-06 / never — pre-fix legacy rows). Tests `EndStateNotificationsTest.php:49,90`.

What’s left: Nothing.

Risk/Notes: Delivery beyond the in-app centre is `fanOut()` (SMS), simulated in this prototype.

Item 52 BLOCKED (LGU)

Checklist: Amendment form is incorrect.

Evidence: An amendment form exists — `ApplyWizard.tsx:1443–1487`, fieldset “What are you amending?” with three checkboxes (`AMENDMENT_KINDS :394–398`: Ownership / Location / Nature of Business) plus “Others (specify)” (`:1474–1480`). Server validation `ApplicationController.php:468–478`; `has_amendments` derived `:514`. **But the paper form has never been seen:** `questions-for-malabon.md:357–365` (§A19) — “We have never seen the paper form. If it asks for more, what we built is the floor, not the finish.” Document request open at `:835–838` (§E2).

What’s left: Obtain the physical amendment form (§E2), then diff the four collected kinds against it. Cannot be closed without that artifact.

Risk/Notes: The tester filed item 52 with no image and no detail. **There is no way to verify “incorrect” against anything in the repo.**

Item 53 DONE

Checklist: Planning/Zoning Office admin account is missing.

Evidence: DB `users` id 15 `zoning@biztrack.local`, `department_id=4` → `departments` id 4 CPD0 / City Planning and Development Office (Zoning), role `zoning_officer` (7 permissions). Created in `ac4e288`. Scope is live: zoning’s assignment-visible application count is 382, vs 1,656 for BPLO.

What’s left: Nothing.

Item 54 DONE

Checklist: No viewing/edit mode in the admin as you check the application form.

Evidence: officer/ReviewPage.tsx:482 `const [mode, setMode] = useState<ReviewMode>('view');` toggle rendered :828 (FilterPills); `const editing = mode === 'edit' && !decided` :643, so a decided review is read-only for good (:641). The applicant's own answers are never editable in either mode (:31-33); only the FOR OFFICE USE ONLY fields — assessed fee, remarks, issuance dates — turn on.

What's left: Nothing.

Item 55 DONE

Checklist: Viewing/downloading submitted documents shows JSON in another tab.

Evidence: All view/download call sites go through bearer-fetched blob helpers: web/src/lib/resources.ts:164 `downloadBlob`, :181 `viewBlob`, both `.catch(throwBlobError)` (:144-157); `documents.download` :406, `documents.view` :409. Single shared control web/src/components/DocumentActions.tsx:61 / :76, used by applicant (ApplyWizard.tsx) and officer (officer/ReviewPage.tsx:221). Commit 59fdfa2 records that the original item-55 fix put the blob logic *inside* ReviewPage so the applicant side inherited nothing; that half was completed there, and the test fixture asserting against zero-byte files was fixed. No raw `<a href>/window.open` on `documents.downloadUrl` exists in web/src.

What's left: Nothing for the JSON-in-a-tab symptom.

Risk/Notes: The 404 in items 65/121b is a **different cause entirely** — see below.

Item 56 PARTIAL

Checklist: Each admin has different roles; they must **NOT** see application forms belonging to other offices. (Read as “must not” — the same tester filed 111 demanding separability.)

Evidence: Row-level boundary holds. api/app/Support/ApplicationVisibility.php:88-121 (`scope()`) narrows any query to `applicant_user_id = me OR whereHas assignments where department_id = mine`, and **fails closed** (`whereRaw('1 = 0')`) for a reviewer with no department. `canView()` :47-62, 403 not 404 :69-77. **Live totals on /applications**: sanitary **1,295** of 1,832; market **4** of 1,832; bplo **1,832** (holds `application.view_any_office`). Cross-office read of app 1898 (routed to BPLO only): sanitary **403**, market **403**, bplo **200**. `application.view_any_office` held by `admin` and `bplo_staff` only.

What's left: ⚠ The *contents* of a filing the office may legitimately open are still unfiltered — see Item 111e. A CHO officer opening a shared filing receives BFP's, OBO's and CENRO's form answers, BFP's inspection findings and every office's assignment remarks.

Risk/Notes: The list/detail gate is correct and provable at the query level; the remaining leak is inside the resource, not the scope.

Item 57 **SUPERSEDED** *(by item 89)*

Checklist: In Other Requirements, let the admin choose the recipient.

Evidence: Item 57 was implemented as the **From office** control, not a recipient control.

`OfficerRequestController::store()` validates `department_id` ('nullable', 'exists:departments,id') and stores `'department_id' => $data['department_id'] ?? $request->user()->department_id`. The `c6bad07` body states item 57 was only half-done: “ `department_id` has been stored since that round but no payload read it back, so choosing an office moved a column no screen displayed.” `from_office` was added to `OfficerRequestResource` in that commit, now rendered at `web/src/pages/RequestsPage.tsx:222–224`.

What's left: Nothing under this number; remaining question tracked as item 89.

Risk/Notes: ⚠ The “Done” mark on 57 was premature when made — the control existed but its value was invisible until `c6bad07` (08-03), five days after the screenshot.

Item 58 **DONE**

Checklist: In the payment receipt, remove the parenthetical extra information on each line item.

Evidence: `PaymentController::receiptLabel` (:174–185) strips `/\s+\([^\)]*\)/u` — only a bracket preceded by a space, so inline codes survive. Applied :154–157, **receipt-only**. Test `PdfDownloadTest.php:108–126` asserts the parenthetical is gone and that `Schedule S(5)` is untouched.

What's left: ⚠ **The same parentheticals are still on screen.** Expanding a row in Payment History renders a card headed “Reference No:” that is a receipt in everything but name (`PaymentsPage.tsx:85–123`), rendering `item.label` raw via `TaxOrderBreakdown.tsx:43`. So does the Pay page and the application detail page. Either apply the same tidy-up there, or expect this item re-filed against the on-screen card.

Risk/Notes: The strip is presentational only — the stored label in `fee_assessments.line_items` keeps the full ordinance wording, so nothing is lost for audit.

Item 59 **DONE** *the clearance “Submit a copy” affordance satisfies it.*

Checklist: Let the user upload a permit they already hold instead of filing a new application for it.

Evidence: `2026_07_29_000020_add_permit_type_to_application_documents.php` (comment names item 59) adds `application_documents.permit_type_id`. `api/app/Support/HeldPermits.php:13–28` documents the mechanism — the copy is an ordinary `ApplicationDocument` under a `HELD_<CODE>` type, and what makes it “held” rather than “applied for” is the permit type’s *absence* from `application_permit_types`, which spares the applicant the office form, the assignment, and the fee (`FeeCalculator::assess` gates on selected permit types). All six held types seeded (ids 12-17) and **12 held documents already on file**. UI: “Submit a copy” per card at `ClearanceStagePage.tsx:929`, stage sentence :718–719, remove control :886–890, applying-for/already-holding mutually exclusive (:475–480). Two endpoints accept it — `DocumentController::store` (:41–72, draft/returned only, refuses the BUSINESS permit itself) and `ClearanceController`. `HeldPermitSubmissionTest.php` (11 cases) passes.

What's left: Nothing.

Risk/Notes: The affordance lives in the post-payment LGU Clearances stage, not inside the wizard — `ApplyWizard.tsx:3186–3196` records that `submitHeldPermit` / `removeHeldPermit` were moved there deliberately. So “in the overall application form” is satisfied one screen later than the tester’s wording implies. The API still accepts it for a draft, so if the tester expects it during the wizard, only UI wiring is missing.

Item 60 DONE

Checklist: Coding error in the BPLO admin — “No query results for model [App] 12”.

Evidence: Reproduced the API side live: `GET /api/v1/applications/12` → **404** for both bplo and sanitary (application 12 does not exist). The UI no longer surfaces it: `officer/ReviewPage.tsx:528-552` catches a 404, treats the path segment as a possible *application* id, resolves it to the real assignment and redirects; `:568-593` renders “This application is not in your queue / The link points at a review that has been completed, reassigned, or removed” with a link back to Application Verification, instead of `ErrorState`. Landed in `ea2765c`.

What’s left: Nothing for the reported path.

Risk/Notes: The fallback calls `assignments.list()`, which the comment `:523-526` notes is the office’s entire assignment history (~2.1 MB for an admin) — **a mistyped URL pulls it down**. Bounded now (50/page server-side) but still the heaviest possible response to a typo.

Item 61 DONE

Checklist: Profile page should store all approved permits of the user.

Evidence: `ProfilePage.tsx:330-333` fetches permits for `business_owner` accounts via `loadAllPermits()` `:64-72`, which walks up to `MAX_PERMIT_PAGES = 10` pages of 200 (`:62`) rather than reading page one only — the comment `:54-61` explains the flat 50/200 cap would under-count a multi-business owner. Grouping `:337-376`. Permits only exist post-approval (issued in `WorkflowService::approveAndIssue`), and `PermitController::index` scopes an owner to their own via `scopeToReader` (`:39-60`). **Observed live:** owner@ Profile shows “1 business total” and expands to both of that owner’s permits (DB: `businesses=1` permits=2).

What’s left: Nothing.

Item 62 DONE

Checklist: Line of business should already be chosen in the zoning section; align with real eBPLS.

Evidence: Picker rendered inline on the zoning step: `ApplyWizard.tsx:4415` (`phase === 'address'`) → `:4443-4449` renders `<FieldLabel required>Line of Business</FieldLabel> + <LinesStep>`, blocking error at `:4450-4455` if empty. The deferred-choice string no longer exists in `web/src`. Separate LOB step gone from `BASE_PHASES` (`:138-146`). Required gate at `:2359`.

What’s left: Nothing on the “chosen first” half.

Risk/Notes: “Align with real eBPLS” is not purely a code question — field-set parity with live eBPLS never confirmed. BLOCKED on BPLO/MISD (questions-for-malabon §A13).

Item 63 NOT DONE

Checklist: Fix the choice names in the revenue-code category list (raw underscored slugs).

Evidence: `web/src/pages/applicant/FeeProfileStep.tsx:69-100` — `COMMON_CATEGORIES` still a literal array of raw slugs containing every value in the tester's screenshot: `essential_retailer (:71)`, `cafe_cafeteria (:75)`, `fastfood_chain (:76)`, `food_peddlar (:77)`, `small_scale_manufacturing (:79)`, `service_establishment (:81)`, `franchise_holder (:82)`, `gasoline_station (:83)`, `water_refilling_station (:84)`, `internet_cafe (:85)`. Rendered unmodified into datalist at `:934-938`. No commit has touched the array.

What's left: Render human labels (`<option value="slug" label="Human">` or a slug→label map). API stores the slug (`ApplicationController.php:585`, free string max:80) so labels must map back on submit.

Risk/Notes: A humanizer already exists officer-side — `web/src/pages/officer/ReviewPage.tsx:376` `humanizeKey()`, applied at `:1182`. So the officer sees “Essential retailer” while the applicant who typed it sees `essential_retailer`. Δ Because the stored value is free text, swapping datalist values for labels without a reverse map would send “Essential retailer” to a fee engine matching on slug — silently zeroing business tax, the same failure mode as the withdrawn “Other” row (`ApplyWizard.tsx:750-755`).

Item 64 PARTIAL

Checklist: Nothing happens when clicking items in Notifications.

Evidence: Rows are clickable now: `NotificationsPage.tsx:243-251` wraps each row in `<Link to={n.link}>` when a link exists (plain `<div>` otherwise), with `markOne(n)` on the `<li>`. All 10,174 notifications in the live DB carry a non-null link (0 nulls). `c922a8a` (07-29) retired the `/track/` and `/review/` prefixes that were never routes. Δ **BUT the tester database still holds 41 rows minted before that fix** — 35 `/track/{id}` (owner@, juan@, test@, 07-24→07-29) and 5 `/review/2` (bplo@) — plus 1 `/queue/3377` (bplo@, 08-03) orphaned by the portal split `ea2765c` (08-04, which renamed the route to `/staff/queue/{id}`). None of those paths exist in `App.tsx`, so clicking them falls to `<Route path="*" element={}<NotFoundRedirect />>` (`:340`) — **the exact “nothing happens” the tester reported.**

What's left: Backfill or retire the 41 stale links (`/track/{id}` → `/applications/{id}`, `/review/{id}` and `/queue/{id}` → `/staff/queue/{id}`), or have the page resolve legacy prefixes client-side. A tester on an old notification still sees the original bug.

Risk/Notes: Two further defects, latent. (1) Δ `NotificationLinkTest.php:47` looks like a guard against exactly this but is **effectively vacuous** — `tests/Pest.php:8-10` applies `RefreshDatabase` against `:memory:` (`phpunit.xml:36`), so it inspects seeded rows, never the tester DB where the dead links live. (2) `NotificationService::newMessage()` gives an officer recipient the link `/applications/{$app->id}` (`:122`), a **citizen-portal** route (`App.tsx:164`); `web/src/lib/api.ts:40-43` states crossing portals must be an `<a href>`, never a `<Link>` — so an officer clicking it would push into a tree their token does not cover and be bounced to sign-in. 4,484 of 4,645 assignments have a named officer so `MessageController.php:539-546` will route to one; 0 such rows exist today only because applicant-initiated messages on assigned filings have not occurred yet.

Item 65 NOT DONE

Checklist: Cannot open the file attached under Other Requirements.

Evidence: Client path is safe (`RequestsPage.tsx:273` → `documents.download` , blob helper). The failure is a **missing file on disk**, not masking. `DocumentController.php:139` — `abort_unless(Storage::disk('local')->exists($document->stored_path), 404, 'File not found.')`; disk root is `storage_path('app/private')` (`api/config/filesystems.php:35`). Read-only DB+disk check: of 2 `officer_requests` rows with a `file_path` , `id=125` is **absent** from `api/storage/app/private/` and **present** in `/Users/kenmondragon/Documents/GitHub/biztrack-demo/api/storage/app/private/` . Same for `officer_request_responses` `id=119` (1 of 2 missing).

What's left: Reconcile the split storage (see 121b). No code change to the download path is needed.

Item 66 DONE

Checklist: Select needs a distinct placeholder when nothing is chosen.

Evidence: `ApplyWizard.tsx:4544` — `<option value="">Select your barangay</option>` , distinct from the `FieldLabel` “Barangay Name” at `:4536` . Fixed by `4932cd6` (08-02). Swept every `<option value="">` in `web/src` : all 15 carry a distinct prompt; none repeats its label. Regression-guarded by `web/e2e/apply-wizard.spec.ts:544` whose forbidden-prefix regex includes `barangay name$` .

What's left: Nothing.

Risk/Notes: The visible *label* is still “Barangay Name” — that is the paper BPLO form’s wording and is correct; the item was about the placeholder.

Item 67 SUPERSEDED

Checklist: Allow free text when “Other” is chosen; allow searching.

Evidence: The “Other” half was deliberately reversed by `76aa6bb` (2026-08-03, “make the trade picker a dropdown again, and drop ‘Other’”) in favour of item 91. `ApplyWizard.tsx:786` filters the catch-all out (`codes.filter(c => c.code !== OTHER_PSIC_CODE)`); `:748–763` records why — the `00000` row carries a NULL revenue-code category and 35 of 36 business-tax rules match on that category, so a line filed under Other was assessed **no business tax at all**. Search half IS implemented and survives: `:875–889` combobox, `:787–792` title+code substring match, uncapped. Legacy Other rows render read-only with explanation (`:1046` , `:1065–1074`).

What's left: Nothing in code. LGU question unanswered — `questions-for-malabon.md:294–301` §A13.

Risk/Notes: Conflicts with items 91 and 104. △ §A13 of `questions-for-malabon` is now stale in the OTHER direction: at line 300 it still tells the reader “we added an ‘Other (not listed)’ option that takes free text”, which `76aa6bb` removed two days later. Anyone briefing the LGU from that doc would misdescribe the build.

Item 68 DONE

Checklist: Location Insights does not work properly; remove AI-sounding descriptions.

Evidence: Two causes, both addressed in `fd7fa3c` (Aug 3) and `b2d0942` (Aug 5). (a) “Does not work” — matching was not broken. Independently re-checked against live SQLite: **711** registered businesses carry coordinates, **43** fall within 500 m of City Hall, densest PSIC group among them is **5 of 43** — so a `0` for a fast-food group is real data, not a bug. The actual defect was the message: `available: false` was one bucket, so an applicant who HAD chosen “Other (not listed)” was wrongly told to “choose your Line of Business first”. Now split into `line_not_chosen` / `line_unclassified` at `api/app/Support/LocationInsights.php:57–61, 223–235`, rendered separately at `LocationInsightsPanel.tsx:161–168`. Second half of the fix is item 69: LOB moved onto the zoning step (`ApplyWizard.tsx:4444–4455`, required) so `psicCodeId` is always populated when the modal opens (`:2875–2880`) — previously null on every new filing, making both “similar” rows read unavailable. 21 Pest tests (`LocationInsightsApiTest.php`). (b) *AI-sounding copy* — every label from the Aug 2 screenshot is gone. `fd7fa3c` diff: “Overall commercial activity in the area.” → “Registered businesses in total”; “Dominant line of business operating nearby” → “Most common line of business”; “Average distance of nearby similar businesses” → “Average distance to a similar business”; trailing full stops dropped. Rationale at `LocationInsightsPanel.tsx:21–33`.

What’s left: Nothing.

Risk/Notes: The footer disclaimer in the Aug 2 screenshot was KEPT by `fd7fa3c` and only removed later by `b2d0942` — see item 116(a).

Item 69 DONE

Checklist: Remove the Line of Business step; already asked in Location & Zoning.

Evidence: `f5f4428` (08-03) deleted the `'lines'` base phase and its label from `BASE_PHASES` / `BASE_LABELS`. PSIC picker now rendered inside the address phase: `ApplyWizard.tsx:4415` → `:4449` (`<LinesStep>`), required check in `case 'address'` (`:2359`). Rationale `:121–126`, `:727–732` — the richer searchable picker survived, the plain `<select>` duplicate was deleted. Observed live: seven chips, none named “Line of Business”.

What’s left: Nothing.

Risk/Notes: Item 69’s own screenshot shows a 7-step order beginning “1 Location & Zoning” with no privacy step — that is the pre-`d223167` build.

Item 70 PARTIAL

Checklist: Double-check default placeholders; no uncommon examples (“e.g. bamboo furniture weaving”).

Evidence: Named instance gone — added in `8b6f1d0`, replaced in `4932cd6` (08-02) with “e.g. mobile phone repair”, then the field removed entirely with “Other” in `76aa6bb`. Full sweep in `a525c05` (08-05, “a placeholder shows the shape of an answer, never an answer”) converted value-shaped to shape-shaped across 8 files. LOB search box now “e.g. retail, food, salon” (`ApplyWizard.tsx:887`) — common words, deliberate. Residual uncommon examples surviving the sweep: `ApplyWizard.tsx:4317` `placeholder="e.g. mobile stall operated from a vehicle"`; `OfficeFormStep.tsx:573` `placeholder="e.g. Two-storey coffee shop with a small roasting area at the rear"`. Both same register as “bamboo furniture weaving”.

What’s left: Decide those two — both are free-text description fields where label + hint already say what to write (`OfficeFormStep.tsx:577–579`), so under “say it once” the placeholder can be dropped. Lower priority: numeric e.g. `45` / e.g. `120` / e.g. `3` (`FeeProfileStep.tsx:1111, 1252, 1137`).

Risk/Notes: `a525c05`’s own message records that item 70 (“realistic examples over masks”) caused the item 113 regression it was fixing. The two items pull opposite ways.

Item 71 DONE

Checklist: Data Privacy Consent belongs first or last, not “Part 5 of 7”.

Evidence: d223167 (08-02). `BASE_PHASES[0] === 'privacy' ( :139 )`; blocks advance (:2415–2416). Observed live: “1 Data Privacy Consent”, footer “Part 1 of 7”, Next disabled. docs/testing-checklist-aug2.md:119 .

What’s left: Nothing.

Risk/Notes: See item 33 — this is the item that pushed Zoning to Part 2.

Item 72 DONE

Checklist: Remove redundant questions (e.g. Business Structure asked twice).

Evidence: Business Structure now derived, not re-asked: `FeeProfileStep.tsx:770–775 , :796` (`derivedStructure = STRUCTURES.find(s => s.value === registrationType)`), :842–859 (rendered as the answer, `readOnly` not disabled); `ApplyWizard.tsx:3529 , :4993` mark the source. Other de-duplications: capitalization once (:281–288 , 97eb5ab); LOB once (item 69); office sheets carry business name/address/trade read-only (`OfficeFormStep.tsx:402–415 , FromApplicationTag`); owner name never asked anywhere in the wizard (grep returns nothing).

What’s left: Nothing.

Risk/Notes: The Occupancy sheet’s “Application Type” label is the one place two different questions still wear the same name.

Item 73 DONE

Checklist: Messages should show which admin is responsible for your application.

Evidence: `MessageController.php:363–378` `responsibleOffice()` emits `{code, name, officer}` per thread, resolved by `responsibleAssignment()` (:341–352) in a documented order — office of whoever spoke last if an officer, else first office with a named officer, else first routed office — and **null** before the filing is routed, rather than inventing an office. Rendered as a labelled line: “Handled by {office · officer}” on each card (`MessagesPage.tsx:114–118`) and in the open-thread header (:283–291), distinguishing three states including “This office has not assigned an officer yet” and “Not yet assigned to an office”. Also searchable (:157–160). Tests `MessageThreadsTest.php:97,119` .

What’s left: Nothing.

Risk/Notes: One office is named even when a filing is routed to several — deliberate, documented at `MessageController.php:262–276` . If an applicant’s sanitary clearance is held by CHO while the thread resolves to BPLO, the header names BPLO.

Item 74 DONE

Checklist: Edit Profile's field information is incomplete.

Evidence: Modal exposes six editable fields plus read-only email: First Name (`SettingsPage.tsx:257`), Middle Name (`:271`), Last Name (`:286`), Suffix (`:300`), Gender select (`:315-334`), Mobile Number (`:335`), Email read-only with the BPLO hint (`:351-366` , `readOnly` not `disabled` so it stays in the tab order). Exact parity with what the API accepts — `updateProfile` validates those six and nothing else (`AuthController.php:216-226`); email deliberately not accepted. `ProtoModal` passed `wide` (`:238`) for the seven-field grid. Profile now also prints Gender (`ProfilePage.tsx:452`), which `:450-451` calls "the other half of item 74". Landed `d48e580` (08-03).

What's left: Nothing for the text fields.

Risk/Notes: The gap between modal and API runs the other way — the avatar. See Item 1.

Item 75 DONE *but read the risk before accepting it.*

Checklist: Remove the "SIMULATED PAYMENT" background watermark from the downloaded receipt.

Evidence: Removed in `fd7fa3c` ; the removal is recorded in place at `api/resources/views/pdf/receipt.blade.php:26-36` . What remains as disclosure: header office line "Official Payment Receipt (Simulated)" (`:40` , 12px, `#333`) and footer "This receipt is for demonstration only. No real funds were collected. Generated by BizTrack." (`:72` , styled 9px `#999` at `:22`). Live render confirms both present, watermark gone.

What's left: A decision from you, below. Also `docs/api-contract.md:132` still describes this endpoint as a "dompdf watermarked 'SIMULATED PAYMENT' receipt" — **stale**.

Risk/Notes: **⚠️ Payments in this build are never real, in any environment.** `PaymentGateway::charge` unconditionally writes `PaymentStatus::Completed // simulated: instant success` (`api/app/Services/PaymentGateway.php:36`). **PAYMENT_DRIVER from `runbook-deploy.md:20` is not read by any code** — it appears only in that runbook and HANDOFF §11.5; there is no `config/payment.php` , no binding in `AppServiceProvider` , no interface, no second implementation. Setting it to anything changes nothing. **Every receipt this system has ever produced is a record that no money moved.**

Item 76 PARTIAL

Checklist: Submit or Apply must be required so the user cannot skip the stage; stage must sit last before submitting.

Evidence: Placement done. `BASE_PHASES` is `privacy, address, business, documents, fees, clearances, review` (`ApplyWizard.tsx:138-146`) — LGU Clearances is step 6 of 7, the last thing decided before Review & Submit, and payment happens after submission (`docs/clearances-before-payment.md:16-25`; commits `4fb2d54`, `13b2c5b`). The requirement exists **only in the browser**. `anyClearanceDecided` (`ClearanceStagePage.tsx:315-317`) feeds `missingFor('clearances')` (`ApplyWizard.tsx:2260-2263`), which disables Next (`:5096-5102`) and blocks forward jumps (`jumpBlocked :2485-2489`, used `:2903`, `:3712`). ⚠ **Server-side there is no such rule.** **OBSERVED** on the throwaway stack: `POST http://127.0.0.1:8081/api/v1/applications/3518/submit`, on a draft whose six clearances were all `available` with no held documents, returned **200** — status `pending_payment`, tracking `BIZ-2026-00479`, `permit_types: ['BUSINESS']`. `ApplicationController::submit (:239-279)` guards only draft status and the amendment rule; `WorkflowService::submit (:84-112)` has no clearance check.

What's left: Add the “at least one clearance decided” guard to `ApplicationController::submit`, alongside the amendment guard already there for exactly this reason (its own comment `:248-253` says the browser is not the only way into the endpoint).

Risk/Notes: The Review step's Submit button is gated on `saving || !consent` only (`:5104-5110`) — it does not re-check `stepMissing`. Holds today because `next()` and `jumpBlocked` are the only ways to reach the last step, but it is one routing change from being bypassable in the UI too. Also `questions-for-malabon.md` A1 records that “at least one” is **our own invented rule**, not something the city asked for.

Item 77 DONE

Checklist: Admin should have a different login page.

Evidence: Same portal split as Item 24. The banner in the screenshot is the *courtesy path*, not the entry point: `LoginPage.tsx:113-120` reacts to the API's 409 and renders `Alert variant="warning" (:175-196)` with “Go there now.” (`:189-192`) pointing at `/staff/login`. The staff entry point is a separate route with its own title “LGU staff sign-in” (`:148-149`) and its own token slot. Live 409 confirmed both directions.

What's left: Nothing.

Risk/Notes: If the LGU wants staff to have no way of *reaching* the citizen page at all, that is a further change — today a staff email typed there is warned and redirected, never authenticated.

Item 78 DONE

Checklist: The dashboard should be transferred to BPLO admin, not super admin.

Evidence: `analytics.view` held by `admin and bplo_staff` — verified directly in the DB and in the live token payload (sanitary's permissions: `message.participate, application.view_all, application.review, permit.view_all, request.create, compliance.view, inspection.manage` — **no** `analytics.view`). Navigating `web/src/lib/nav.ts:59`, filtered by `!item.permission || user.permissions.includes(item.permission)`; `analytics` sub-routes carry the same gate (`App.tsx:261-298`). Staff landing filters the same way (`DashboardPage.tsx:71-76`).

What's left: Nothing, if “transferred to” means “BPLO admin can reach it”.

Risk/Notes: ⚠ There is **one** staff dashboard route (`/staff/dashboard`) shared by `admin` and `bplo_staff` — `analytics` cards are permission-gated, not role-partitioned. If item 121 asks for *super admin to lose* the dashboard, that is not what the code does: `admin` still holds `analytics.view`. Also BPLO does **not** hold `inspection.manage`, so `GET /inspections` returns **403** live for `bplo@biztrack.local` and the Inspections nav item is absent for them.

Item 79 DONE

Checklist: Profile shows approved permits; View renders a physical-counterpart certificate; allow saving as PDF.

Evidence: All three levels reached. (a) List — `ProfilePage.tsx:462–508` “Approved Businesses”. (b) View — each permit row links to `/permits/{id}` (:301–307), rendered by `PermitDetailPage.tsx` as a bordered certificate: seal + REPUBLIC OF THE PHILIPPINES / CITY OF MALABON / office (:197–211), permit type as document title (:221–223), QR (:214), and the paper form’s field grid — Name of Owner, Business Name, Trade Name, Business Address, Line of Business, Permit No., Permit Type, Date of Issue, Valid Until, Tracking ID (:231–253) — plus Remarks box and two signature lines (:258–275). Fields come from `PermitController::certificateData` (:133–190), **the same array that feeds the PDF blade** (:96), so screen and download cannot drift. **Observed live at** `/permits/1`: title “Mayor’s / Business Permit”, owner “Nena Dela Cruz”, MCB-2026-000001, BIZ-2026-00001, CITY MAYOR / OFFICER-IN-CHARGE captions. (c) PDF — `PermitDetailPage.tsx:292–298` Download PDF → `permits.pdf()` → `GET permits/{permit}/pdf` (`api/routes/workflow.php:173`) → `PermitController::pdf` (:89–110), plus a per-row download button on Profile (`ProfilePage.tsx:187–216`, observed as button “Download Mayor’s / Business Permit for Nena’s Sari-Sari Store (MCB-2026-000001) as PDF”). Covered by `PdfDownloadTest.php` and `PermitCertificateTest.php`.

What’s left: Nothing.

Risk/Notes:  `verify_url` on the rendered certificate reads `http://localhost:5173/verify/...` in this environment — the `FRONTEND_URL` config matter from HANDOFF §15.1, not this item, but it **would print a localhost URL on a downloaded permit**.

Item 80 PARTIAL

Checklist: No reject button in some offices; after rejection allow remarks, reflected on the owner’s Track page.

Evidence: Remarks half done. Route `POST /applications/{application}/reject` behind `permission:application.reject` (`api/routes/workflow.php:155–156`); `ApplicationController.php:375–394` validates `reason` (required, ≤ 1000) and calls `WorkflowService::rejectApplication`, which writes `applications.rejection_reason` and sets status `rejected` (`WorkflowService.php:197–202`). Owner side renders it at `ApplicationDetailPage.tsx:274–279`. UI captures it: `RemarkPopup` “Reason for rejection”, Confirm disabled while empty (`ReviewPage.tsx:251–252`, `315–323`), second guard `:712–715`. The reject-button half is a **deliberate refusal**: `canReject = application.reject` (:479), held by admin and `bplo_staff` only; the other six offices get “Return with remarks” instead, moved next to Approve (:850–863). Reasoning recorded `:458–478`: a per-office rejection has no state — `AssignmentStatus` has no such case and `afterReviewProgress` would stall on one forever.

What’s left: Decide with the LGU whether an office-level *rejection* (as distinct from a return) is really wanted. If yes it needs a new `AssignmentStatus` case and a `WorkflowService::afterReviewProgress` branch — **not a button**.

Risk/Notes: The tester will still see “no reject button” in six offices until that decision is made. Put it in front of them explicitly rather than leaving the item open.

Item 81 DONE

Checklist: Fully approved applications should leave Track and appear on Profile.

Evidence: `ApplicationsPage.tsx:42` defines `FINISHED = ['approved', 'issued']`; `:369` builds the rendered list as `submitted.filter(a => !FINISHED.includes(a.status))`. `:370` counts what moved and `:418–431` prints “N approved applications are now in your Profile” linking to `/profile`; empty state `:497–507` says “Every application you have filed has been approved. The permits are in your Profile.” Approved/issued also removed from the status filter (`:70–88`) so no control can bring them back.

What’s left: Nothing.

Risk/Notes: The Juan’s Cafe screenshot showed a *paid* card with six approved permits — the card leaves Track only when the parent application reaches `approved / issued`, not when its individual permits show Approved chips. `WorkflowService::approveAndIssue` makes those coincide (comment `:38–41`), but a filing whose per-office assignments are all complete while the application row still reads `under_review` would still sit on Track; that is the item 111 family, not item 81.

Item 82 BLOCKED (LGU)

Checklist: Fix the amendment page; refer to the amendment form.

Evidence: Same as item 52. The amendment questions were moved out of the wizard’s Business step into the entry modal by `26b5e96` (`ApplyWizard.tsx:1443–1487`), so the “page” now asks the four kinds up front. Comparison target unavailable: `questions-for-malabon.md:835–838` (§E2), and §E preamble `:817–818` — “Please ask for copies, not descriptions. Every attempt to work from a verbal description has produced a form that does not match the real one.”

What’s left: Obtain the paper amendment form (§E2).

Item 83 PARTIAL

Checklist: In the admin’s Other Requirements, clicking Request crashes the system.

Evidence: **Not reproducible against the local API.** Every request the page makes returns 200 fast: `/requests?page=1` (sanitary 31 ms/52 KB, bplo 20 ms/70 KB), `/reference/departments` (7 ms), `/applications?per_page=200` (sanitary 503 ms, bplo 33 ms). Compose posts `{request_type, subject, body, department_id}` (`RequestsPage.tsx:440–445`) to `POST /applications/{id}/requests`; the controller accepts both naming conventions (`OfficerRequestController.php:44–47`) and validates cleanly (`:49–66`). Submit gated on a chosen application (`:461`) so `Number(appId)` cannot produce `NaN`. Same root cause as Item 100.

What’s left: ⚠ **A real remaining defect on this page:** the compose picker calls `applications.list()` (`RequestsPage.tsx:594–595`), hard-capped at `PICKER_PAGE_SIZE = 200` (`resources.ts:122`, **verified live** — `per_page=500` still returns 200 rows of 1,832). A BPLO officer therefore **cannot select 1,632 of the applications they are allowed to raise a requirement on**. Identical shape to the bug `059e4a7` fixed for renewals (“offer every business, not the first page of them”) — needs a searchable/async picker.

Risk/Notes: “Crashes” was almost certainly the gateway, not the app (Item 100). **Do not close 83 on that basis alone** — the truncated picker is a separate, real failure the tester may have hit at the same moment.

Item 84 **BLOCKED** (LGU)

Checklist: Fix the amendment form; refer to the physical/paper application.

Evidence: Identical to 82. No PDF, image, or transcription of the paper amendment form exists in the repo — the only received form is the CPDD locational clearance (`questions-for-malabon.md:844` §E4 ANSWERED). §E2 still open. Server persistence is complete and tested (`api/tests/Feature/AmendmentDetailsTest.php:33–158` , 9 cases including “refuses to submit an amendment that amends nothing” :102–112).

What's left: Obtain the paper form (§E2), then diff. Until then this is a City Hall decision, not an engineering task.

Item 85 **DONE**

Checklist: Renewal must not be the same as the application form; must ask for an ID to identify which permit.

Evidence: The renewal modal gates the wizard (`ApplyWizard.tsx:1745` — opens when `isReuse && !draftIdParam`) and the permit chosen there prefills business name, trade name, registration type/number, TIN, address, lessor block, emergency contact, economic organization, officers, lat/lng and business lines (:1781–1853); capitalization deliberately not re-asked because renewals are assessed on gross sales (:1831–1835). Permit identified by permit number, shown on each radio option (:1410–1416). Interpretation recorded at `questions-for-malabon.md:367–372` (§A20): “*we interpreted ‘ID’ as the permit number.*”

What's left: Nothing, unless City Hall answers §A20 with a different identifier (see 110).

Item 86 **PARTIAL** *the water half is BLOCKED (LGU)*

Checklist: Put validations on the zoning map — owner should not pin on water.

Evidence: A boundary check exists, **client-side only**. `ApplyWizard.tsx:222–237` defines `MALABON_BOUNDS` (14.645–14.700 N, 120.930–120.985 E) and `withinMalabon()` ; enforced on pin drop at :4485–4490 (rejects with a named message, never stores) and re-enforced when leaving the step at :2390–2392 , so a renewal or reopened draft carrying a bad coordinate is also caught. The screen never claims more than it checked — :4409–4413 , :4478–4484 , :4509–4517 (“CPDO checks the actual site during processing”), and :210–221 states plainly this does not prove the pin is inside city limits and does not detect water.

What's left: (1) Port `MALABON_BOUNDS` into the API's address validation — the client check is a UX guard, not an enforcement point. (2) Water/no-build detection needs data the project does not have: a hydrography or coastline layer — `questions-for-malabon.md` **C6** (line 620), relatedly **C7** (flood/no-build overlay) and **C8** (the city's actual boundary — the current rectangle necessarily includes slivers of Navotas, Caloocan and Valenzuela).

Risk/Notes: Deliberately not faking it is the right call and is documented — a water check that silently passed everything would put the city's name behind a guarantee nobody made. **Do not “fix” this by shipping a guessed polygon.**

Item 87 PARTIAL

Checklist: Errors in passing data for inspections on both business-owner and admin side.

Evidence: The payload defect is fixed: `ApplicationController.php:52-53` eager-loads `inspections.application:id,tracking_id,business_id` and `inspections.application.business.address.barangay`, and `InspectionResource.php:25-28` uses `relationLoaded()` rather than `whenLoaded()`, so an unloaded relation is no longer emitted as `business: null` and read as “removed from the register” (`web/src/lib/types.ts:440-467` documents the distinction). Inspections are department-scoped: `InspectionController.php:139-140` and `:152-154` (403 “This inspection belongs to another department”). **Live:** `GET /inspections` → sanitary 200 (50 rows, total 1,249), market **403**, bplo **403**.

What’s left: Two live problems. (1) `bplo_staff` has **no** `inspection.manage`, so the BPLO admin — the office coordinating every other office’s clearance — cannot open the Inspections screen at all. Confirm that is intended. (2) Inspection findings **leak across offices** through the application payload (Item 111e): `GET /applications/1707` as `sanitary@biztrack.local` returned BFP’s findings verbatim — “*Fire exit obstructed and no serviceable extinguisher on the premises.*”

Item 88 DONE

Checklist: Put a search on the Track page of both business-owner and admin sides.

Evidence: Both have one; fixed in `f766bc4`. - Owner Track (`/applications`, nav label “Track” per `nav.ts:49`): searchbox `ApplicationsPage.tsx:443-453` with a real `sr-only` label; matcher `:115` covers tracking ID, business name, and the applicant’s own title; result count announced via `role="status"` `:476-481`; empty state with “Clear search and filters” escape `:494-519`. - Staff/admin Track (`/queue`, nav label “Track” per `nav.ts:55`): searchbox `QueuePage.tsx:369-379`, matcher `:132-136` (tracking ID + business name; no applicant title on `AssignmentResource`). - **The admin IS covered:** the `admin` role holds `application.review` (`RbacSeeder.php:110-117`), the permission gating that nav entry. - **Browser-verified by test:** `track-search.spec.ts:134-171` (owner: tracking-ID fragment, business name, and the invisible title all match) and `:308-324`, `:361-370` (officer: narrows, reports coverage, clears).

What’s left: Nothing functional.

Risk/Notes: Two cosmetic notes. It is a search *field* filtering as you type, not a submit *button* — if the tester meant a literal button they may re-file, though live filtering is the better interaction. And the comment at `QueuePage.tsx:365-368` justifies the hidden label by saying “the magnifying-glass context is obvious visually” — **there is no magnifying glass:** neither page imports `SearchIcon`, and `type="search"` renders no icon. The field’s only visual cue is its placeholder. Separately, the Expo companion (`mobile/src/screens/TrackListScreen.tsx`) has type-filter chips and no search at all; not mentioned in HANDOFF, assumed out of scope.

Item 89 PARTIAL

Checklist: Requests for other requirements should have recipients; admin should choose who receives them.

Evidence: ⚠ **The implemented control answers a different question than the one asked.** The screenshot's "From office" dropdown is *sender* attribution (`RequestsPage.tsx:506–522` , label "From office", helper "The office the owner sees this request coming from", posting `department_id`) — that is item 57's control. The *recipient* side was added in `c6bad07` as a **read-only** field: "To (recipient)" at `:491–504` , populated from the chosen application's applicant (`:427–433`), helper "Requests go to the business owner who filed the application. Pick a different application to write to a different owner." So the recipient is **named**, not **chosen**. Reasoning at `:37–53` and in the `c6bad07` body: `POST /requests/{id}/respond` is gated on `request.respond` , a permission only `business_owner` holds, so a picker offering an office would create a request that "would arrive nowhere, be answerable by nobody, and notify the applicant regardless." 8 tests in `OfficerRequestRecipientTest.php` , `e2e/web/e2e/requests.spec.ts:110–153` .

What's left: If the client meant "route a requirement to another office" (the literal reading), it is not built. `c6bad07` scopes the work: add `officer_requests.recipient_user_id / recipient_department_id` , grant `request.respond` to office roles, rewrite list scoping plus `requestCreated / requestResponded` notification targeting. If the client only meant "say who this is going to", it is done. **This needs a client decision, not more code.**

Risk/Notes: 57 and 89 are the same complaint filed twice, resolved as two halves of one form — 57 = FROM (a real select), 89 = TO (a name). Both marked Done, but only 57's control is actually a choice. Say this to the client in exactly those terms so "Done" is not mistaken for a routing feature.

Item 90 PARTIAL

Checklist: Sort/Filter should be fixed.

Evidence: Items 8 and 90 are the same complaint filed twice (8 from July 24, `testing-checklist-status.md:20` ; 90 from Aug 2, `testing-checklist-aug2.md:50`). The underlying defect was that `<SortFilter />` rendered with **no props** is documented "static ornament" mode (`Proto.tsx:433–435`) — it looks like a control and does nothing. Per page today: - **Owner Track /applications** — DONE. Sort + filter + search client-side (`ApplicationsPage.tsx:386–410`), correct here because `applications.list()` asks for the 200-row ceiling. "Deadline soonest" correctly sorts null deadlines last rather than at epoch zero. E2E `track-search.spec.ts:173–205` . - **Officer/admin queue /queue** — DONE with a documented API-side remainder. Filter is a real server query (`application_status`) so tab totals stay exact; sort and search run over loaded rows because `AssignmentController::index` accepts neither a `q` nor an ordering parameter, **and the page says so out loud** ("Showing 1 of the 3 loaded"). Reasoning `QueuePage.tsx:86–108` ; `e2e :326–359` . - **Payment History** — PARTIAL, see Item 8: sorts and filters only the first 50 rows, silently. - ⚠ **Still ornamental** — five pages render props-less `<SortFilter />` and it remains dead: `RequestsPage.tsx:630` , `admin/UsersPage.tsx:717` , `admin/OwnersPage.tsx:319` , `officer/InspectionsPage.tsx:115` , `applicant/DraftsPage.tsx:75` .

What's left: (1) Fix the Payment History page size (Item 8). (2) Decide, per page, on the five ornamental call sites: wire them or delete the ornament. In props-less mode `SortFilter` renders a plain `<span>` , not a button (`Proto.tsx:485–487` , `:505–507`), so **it misleads the eye, not the keyboard**. (3) The real fix for the officer queue is `q` + ordering params on `AssignmentController::index` ; until then sort and search there cover only the loaded 200.

Risk/Notes: `testing-checklist-aug2.md:138` self-reports item 90 as "Partly" — that matches, and **the five ornamental pages are the part that report does not mention**.

Item 91 DONE

Checklist: LOB dropdown; keep search; scroll bar; all choices visible unsearched; no “Others”.

Evidence: All five parts in `ApplyWizard.tsx`. Dropdown :892–901 (`absolute z-[1100]` gated on `open`, `close-on-outside-click/Escape` :812–826, `role="combobox"` `aria-expanded` `aria-controls`), search :787–792, scroll :940 (`max-h-64 overflow-y-auto`), all-visible :800–804 (`[...common, ...listed]`), headings “Most common” :958–962 and “All other trades (N)” :963–967, no `.slice()`, no Others :786. E2E asserts uncapped: `web/e2e/apply-wizard.spec.ts:264–314`, incl. `expect(results.locator('button')).toHaveCount(total)` at :303 and guard comment “the 25-row cap is back” at :310.

What’s left: Nothing.

Risk/Notes: Directly contradicts item 67. 91 is the later filing and won. Hinges on an unanswered LGU question (§A13) — if BPLO confirms “Others” exists, reopen 91’s last clause, do NOT re-implement 67, because the fee engine cannot assess a NULL category.

Item 92 DONE

Checklist: Change GIS legend colours to green and red (screenshot shows uniformly blue pins).

Evidence: `web/src/pages/admin/AnalyticsPage.tsx:114–115` — `MAP_VALID = '#125c3b'` (dark green), `MAP_LAPSED = '#c11212'`. Applied to markers :1098–1109, mirrored by legend swatches :1036–1056. Landed in `5de99b8`, refined by `5af0650`.

What’s left: Nothing.

Risk/Notes: (1) Comment at :104–105 is stale — says “valid -> small (r 3.5)” but code is 4.5 (`5af0650` narrowed the gap to stop red overstating the lapsed share). (2) That narrowing weakened the primary non-colour cue to a 1px radius difference; solid-vs-hollow still carries it, but at 700+ overlapping points on a greyscale printout the two states are closer than the comment implies. No accessibility failure, but it is the cue most likely to erode under further tuning.

Item 93 DONE

Checklist: Permits on Profile should be a business-name accordion, not a flat card list.

Evidence: `ProfilePage.tsx:226–315` `BusinessRow` is the accordion: a real `<button aria-expanded aria-controls>` heading showing business name + “Permit Expiration: ” (:240–244, 250–269), opening a panel of permit rows each with a view (eye) link to `/permits/{id}` and a separate download button (:284–311). Grouping by business :337–376, sort/filter wired to real state :384–405. **The duplicate flat screen is gone:** `web/src/pages/applicant/PermitsPage.tsx` is now `return <Navigate to="/profile" replace />`, and its header comment states the two routes both rendered a page titled “Profile” and only the flat one was reachable from the nav — which is what the client filed. Commit `bf4b182` (08-03).

What’s left: Nothing.

Risk/Notes: The design’s fixed six-row template is rendered from the permits actually issued, so a business shows only the ones it has — correct behaviour, but it will not match the mock row-for-row.

Item 94 DONE

Checklist: Ask Type of Registration first; the number field must adapt (DTI/SEC/CDA).

Evidence: Fixed by 59fdfa2 (08-03). Type of Registration radiogroup renders at ApplyWizard.tsx:3939–3980 , number field at :3982–4046 — structure above number, reversing the screenshot. Mapping :514–519 REGISTRATION_TYPES (sole prop→DTI, partnership→SEC, corporation→SEC, cooperative→CDA), :531–551 REGISTRATION_AGENCIES per-agency label/example/hint, agencyFor() :553 . Number input is readOnly (never disabled) until a structure is chosen (:4004–4006) with live-region announcement :4033–4040 . “Still needed” list ordered structure-then-number on purpose (:2296–2314). Server BusinessController.php:335 bands to four structures, normalizeRegistrationType translates legacy agency values (:305–313) — “SEC” deliberately does not translate since it covers two structures (:295–303). Business::REGISTRAR_BY_FORM (api/app/Models/Business.php:102). E2E apply-wizard.spec.ts:445 ; Pest RegistrationTypeTest.php .

What’s left: Nothing.

Risk/Notes: The number is validated identically for all three agencies (:379 charset + ≥1 digit + min:4). The 40-line docblock at :337–378 justifies this from SEC’s and CDA’s published registers; a per-agency regex would refuse real certificates. So the field adapts (label/example/error) without number and agency being cross-checked. A cross-check would need LGU sign-off on acceptable formats.

Item 95 DONE *the screenshot is stale*

Checklist: Remove the BizTrack logo from the permit template; use the Malabon official seal.

Evidence: Two commits, **both after the screenshot:** - b39357a — 2026-08-05 16:18:44 +0800 — “take our logo off a government certificate...”. Diff on PermitDetailPage.tsx removes import { Logo } and <Logo height={24} /> from the certificate header. Left a labelled empty slot because the artwork was not yet in the repo. - b2d0942 — 2026-08-05 17:20:23 +0800 — added web/public/malabon-seal.png and api/public/malabon-seal.png (both 38,422 bytes; --diff-filter=A confirms first appearance) and wired the seal into PermitDetailPage.tsx and api/resources/views/pdf/permit.blade.php . The checklist screenshot is dated **Aug 3** — it predates both commits by two days and shows the pre-fix state. Seal present in **both** renderers: on-screen PermitDetailPage.tsx:197–204 ; PDF permit.blade.php:102–104 guarded — @if(file_exists(public_path('malabon-seal.png')) @endif (absolute disk path so dompdf does not fetch over HTTP). No vendor mark remains in the blade; the last “BizTrack” string there was removed in d48e580 (08-03).

What’s left: Nothing.

Risk/Notes: The file_exists guard means a deploy that misses api/public/malabon-seal.png prints a **sealless PDF silently** rather than erroring — acceptable, but worth a deploy checklist line. HANDOFF §9.1’s claim that the PDF never carried the logo checks out: the blade’s only vendor reference was a footer sentence, removed Aug 3.

Item 96 PARTIAL

Checklist: Documentary requirements should match the paper form (should be 6); cannot be viewed or downloaded.

What's left: (a) BLOCKED (LGU) — E9 must come back before “matches the paper form” can be claimed. (b) △ The applicant has **no view/download for their own documents after submitting**:

`web/src/pages/applicant/ApplicationDetailPage.tsx` renders no documents section at all (the only document matches are `document.activeElement`). View/Download exist in the wizard (draft/returned) and on the officer's Review sheet, but not on `/applications/:id`.

Risk/Notes: If the tester was looking at a *submitted* application when they wrote “it cannot be viewed or downloaded now”, gap (b) is the live defect and the fix is one `<DocumentActions>` per document on `ApplicationDetailPage`.

Item 97 PARTIAL

Checklist: Paper forms must match system forms, without redundant fields.

Evidence: “Avoid redundancy” half DONE — `fa3f107` explicitly rejected re-asking Form of Organization, Business Area, “Do you pay rent”, Capital Investment, No. of Delivery Units because each already exists; owner name nowhere in the wizard; carried values render read-only with `FromApplicationTag` (`OfficeFormStep.tsx:337`, `:402–415`). “Match the paper” half incomplete: same four items as Item 2, **plus a regression** — `products_services` (“the second column of the paper's line-of-business table on both BPLO forms and on CENRO's CEC application”) was added by `fa3f107` and removed again hours later by `b39357a` (08-05); the input is gone, replaced by a comment at `ApplyWizard.tsx:1092–1107`, while the DB column, API validation and officer review sheet still handle it.

What's left: Decide whether Products/Services returns “somewhere quieter” (the code's own words) or the paper column stays unfilled; owner residential address; partners/incorporators; semi-annual mode; Occupancy/FSIC checklists.

Risk/Notes: BLOCKED (LGU) on whether the counter needs Products/Services; A22; E9. △ `questions-for-malabon.md` §E1/§A19 still assert the BPLO and amendment paper forms have never been seen, which the transcribed code contradicts — reconcile before handing to City Hall, or BPLO will be asked for forms they already sent.

Item 98 DONE

Checklist: Market Clearance must not be required — only for stall holders.

Evidence: Nothing requires MARKET specifically. The step rule is `.some` over all rows and names no code (`ClearanceStagePage.tsx:315–317`); `ClearanceService::clearanceTypes` applies no per-code rule (`:51–63`); submission validates no clearance at all (observed under item 76). The card says who it is for:

`APPLICABILITY.MARKET = 'Optional – only if you trade from a stall in a public or private market. Skip it if you do not.'` (`:141–143`), rendered as a plain muted line (`:788–792`) and tied to both buttons via `aria-describedby` (`:751–754`) so a screen-reader user hears it before pressing either. **Observed live:** that sentence appears on the Market card and no other.

What's left: Nothing for this item.

Risk/Notes: ⚠ **This is where the double reversal left debris — misleading rather than harmful.**

`marketClearanceApplies` and `MARKET_CATEGORIES` (`ClearanceStagePage.tsx:162–213`) are exported and have **zero call sites** anywhere in `web/src` or `e2e` — confirmed by `grep`. The comment block at `:566–584` still describes a `.filter` that no longer exists; `:601–603` claims “`marketShown` still computes above” when that variable is gone; and `:711–713` states “item 98 keeps the one such card off the grid entirely”, which **directly contradicts** `:605` (`const visibleRows = rows`). A reader who trusts the comments will conclude the card is hidden. HANDOFF §6.2 warns “do not reintroduce conditional hiding” — **the stale helper is the most likely way that happens by accident.**

Item 99 DONE

Checklist: Remove the email-verification banner pinned to the top of every page.

Evidence: Banner gone from the shell, with a comment standing in its place:

`web/src/components/AppShell.tsx:266–273` — “No ‘verify your email’ banner here (tester item 99). It nagged on every screen and claimed verification was required before submitting, which no route actually enforces... If it ever becomes a real gate, block the action that needs it — don’t put the nag back on top of every page.” Removed in `d2f38ab`, whose message adds: “It also told a falsehood... there is no verification middleware on any route.” Repo-wide `grep` for the banner strings returns **no** current hits under `web/src` — only the two historical commits `59d6690` (introduced) and `d2f38ab` (removed). Capability correctly left intact: `VerifyEmailPage.tsx:32` still handles the emailed link; `ProfilePage.tsx:442–443` still prints status.

What's left: Nothing.

Risk/Notes: ⚠ Read with item 29: removing the banner was safe **only because verification is not enforced anywhere**. If BPLO later decides verification must gate submission, this removal becomes a UX trap — blocked at submit with no on-screen reason. The `AppShell.tsx:271` comment already prescribes the right answer for that day (gate the action, explain at the action); honour it rather than reverting to a global nag.

Item 100 PARTIAL

Checklist: Fix the Other Requirements page; it should load properly.

Evidence: ⚠ **83 and 100 are the same defect, and the cause is the tunnel, not the app.** The string appears in exactly one branch of `toApiError` — a response with an HTTP status but no Laravel `message` (`web/src/lib/api.ts:160–164`), rendered by `ErrorState()` (`primitives.tsx:127–141`). The API answers every error with the Laravel envelope (**confirmed live:** the 403s, 404s and 409s in this audit all carried `message`), so a missing `message` means the body was never ours — `cloudflared` HTML. **This is HANDOFF §14.6 exactly.** Every endpoint this page touches returns 200 locally. Commit `9f3b489` added a distinct gateway string at `api.ts:153–158`.

What's left: ⚠ **9f3b489 is not deployed.** HANDOFF §15.3 records `main` ahead of `demo`, `9f3b489` among them — so a tester on the tunnel today still sees the misleading “Something went wrong on our end.” for a gateway hiccup. Deploying it (which drops open tester sessions and reissues the tunnel URL) is what actually closes this item for the tester.

Risk/Notes: Do not “fix” the Other Requirements page. There is nothing wrong with it.

Item 101 DONE

Checklist: No existing form for the zoning/location clearance; add one based on the paper form.

Evidence: ZONING is in both halves of the office-form list — `PermitType.php:50` and `OfficeFormStep.tsx:93–100`. `ZoningFields` (`:505–687`) is built against CPDD's real form: `OFFICE_FORM_META.ZONING.ref = 'MCG-CPDD-F0-003 · v1.2'` (`:119–123`), and each field comment names the roman numeral it stands in for (VII `:527–537`, VIII `:561–566`, VIII.A/B `:582–608`, VIII.C/D `:609–629`, VIII.E `:632–648`, IX `:652–684`). Earlier INFERRED guesses were deleted when the paper arrived (`:38–52`). **Observed live:** sheet renders with sections A Application Details, B Project Description, C Authorized Representative.

What's left: Nothing in code.

Risk/Notes: Two elements of the paper deliberately not built and recorded rather than shipped — the hand-drawn Sketch of the Location (needs upload or canvas) and the “MUST BE NOTARIZED PRIOR TO SUBMISSION” declaration, which the online flow has no step for (`:55–62`; `questions-for-malabon.md` C9 line 645, E4 line 844, both ANSWERED). One paper field, II. Home Address, has nowhere to come from — an account-level gap.

Item 102 PARTIAL

Checklist: Simplify the terms/words used in analytics descriptions.

Evidence: A deliberate plain-language pass exists: db81ab0 , 59915b4 , 0f901dd (08-02), rendered by web/src/components/ui/MetricInfo.tsx:79–162 under three headings (“How it is measured” / “What it covers” / “Why it is here”). Most labels are now lay-readable. **Residual jargon, on screen:** - BusinessGrowthPage.tsx:408 label "Cohort Survival Rate", :497 on-screen survival.methodology; AnalyticsDefinitions.php:446–456 still leads with 'label' => 'Cohort survival' and “at the furthest cycle any business in the register has reached”. - AnalyticsDefinitions.php:252 — “The centre line and the normal range around it are worked out from the first 24 weeks on the chart and then held still, so every later week is measured against the same yardstick.” - AnalyticsDefinitions.php:273 — “A running average that counts the newest week most and each older week less and less... travelled more than half way from the centre to the edge of the normal range.” - ProcessingTimePage.tsx:146 and AnalyticsPage.tsx:366 both use the metaphor “the same yardstick”.

What's left: Rename “Cohort survival” to a plain heading (the gloss already exists in the formula text); replace “centre line”, “normal range”, “running average” and “yardstick” with the office's own words. §D2/D3 (questions-for-malabon.md:775–796) ask BPLO for exactly that vocabulary and are unanswered.

Risk/Notes: ⚠ AnalyticsDefinitionsTest.php:199 bans probability, probable, likelihood, predict, forecast, confidence in renewal-risk definitions and **fails the build** — any rewrite must not reach for prediction language.

Item 103 PARTIAL

Checklist: Fix GUI shapes/formatting; things should align.

Evidence: be6f872 (08-04) did a measured pass — nine screens that overflowed at 390px brought to exactly 390, nav rail pitch (71px vs 83px) evened, filled/outlined row buttons matched, wizard progress bar re-centred (still in place at ApplyWizard.tsx:5069–5077). The same commit **deliberately leaves two things broken:** .tnum is inert because neither Poppins nor Prata ships tabular numerals — still present at web/src/index.css:173–174 , still applied at ApplyWizard.tsx:3735 , so every money column and officer table wanders; and the radius vocabulary is still mixed app-wide.

What's left: Choose a numeral font (or drop .tnum and stop implying alignment); normalise radius vocabulary. Both are open design decisions — DESIGN.md §3 leaves the numeral font unspecified.

Risk/Notes: ⚠ No regression test guards the 390px work — grep scrollWidth web/e2e/*.ts returns nothing, so the measurements exist only in a commit message. fa3f107 then added ~623 lines to ApplyWizard.tsx after the measurement pass with no re-measurement. Live 390px check attempted but the MCP browser flapped between /login and /dashboard (handoff §14.9); **CANNOT VERIFY** that the post- fa3f107 Business Information and Location & Zoning steps still measure 390. A Playwright test asserting documentElement.scrollWidth === 390 on every applicant route would settle it and stop this item reopening.

Item 104 DONE

Checklist: Selected LOB does not reflect after choosing; all lines should appear.

Evidence: (a) Confirmation now pinned INSIDE the open dropdown at :924-932 — tinted bar reading Selected (N): <titles>, so it cannot be occluded by the absolutely-positioned list. Root cause recorded at :903-922 (document.elementFromPoint over the old heading returned a result row). Backed by always-mounted aria-live="polite" (:1028-1030) and persistent Selected panel (:1032-1034). Titles named not counted (:858-861). E2E apply-wizard.spec.ts:204-247. (b) No cap in memo (:784-805); footer states count at :1012-1018.

What's left: Nothing functionally.

Risk/Notes: ⚠ HANDOFF IS WRONG. docs/HANDOFF.md:410-411 says “135 PSIC codes seeded; the picker shows 136 options (135 + the ‘Other’ affordance)” — both numbers off: 135 INCLUDES Other, and the picker shows 134 because Other is excluded. Same off-by-one repeated at FeeProfileStep.tsx:920-921 and ApplyWizard.tsx:4433. The e2e test derives the total from the API and filters 00000 itself, so it is correct — only the prose is wrong.

Item 105 DONE *the screenshot is stale*

Checklist: TIN as four boxes of three digits, no dashes typed.

Evidence: web/src/components/TinInput.tsx — four maxLength={3} numeric boxes (GROUP=3, GROUPS=4 at :27,30), auto-advance, Backspace/Arrow traversal across boundaries, paste-spreading (handlePaste, guards against maxLength silently truncating a pasted TIN), splitTin / joinTin preserving the dash-joined wire format so normalizeTin and businesses.tin are untouched. Mounted ApplyWizard.tsx:4062; old single field with placeholder="000-000-000-000" confirmed deleted in the 816a1b6 diff.

What's left: Nothing.

Risk/Notes: The fourth box is not hard-capped at 3 digits on read-back — splitTin gives it everything from digit 10 on, deliberately, because the API accepts a 3-5 digit branch code and truncating would corrupt a stored filing on the way to the screen. maxLength still limits typing. Real <fieldset> / <legend>, four distinct aria-labels, error described once on the group.

Item 106 DONE

Checklist: Remove capitalization here (asked earlier); verify “category” vs line of business.

Evidence: Both halves settled by 97eb5ab (08-05, “ask for capital once, and say what the category actually is”). Capital: commit removes capitalization from LineDraft, from toggle(), deletes the Capital (P) block from the Selected panel. Current state ApplyWizard.tsx:281-287 + do-not-restore marker :1049-1060. Asked in exactly one place now, FeeProfileStep.tsx:1004-1015, only for new filings. API backfills business_lines.capitalization from the fee profile (ApplicationController::syncLineCapitalization); covered by api/tests/Feature/LineCapitalizationTest.php. Category ≠ LOB documented at FeeProfileStep.tsx:914-926; heading renamed to “Business Structure & Tax Classification” (:840). Independently confirmed: 273 distinct business_category values in fee_rules.conditions vs 134 real PSIC codes, and psic_codes.category is NULL/empty for all 135 rows — nothing can derive one from the other.

What's left: Nothing.

Risk/Notes: Fee step still asks capital per line; harmless only while item 115 holds one line.

Item 107 DONE

Checklist: The “Don’t apply” control must not look like a warning message.

Evidence: ClearanceStagePage.tsx:846–855 renders it as a plain bordered secondary button (`border border-input-border bg-white text-ink-secondary`), replacing the previous `text-s-red` underlined link. **OBSERVED computed style** in the browser on the Sanitary card: `color: rgb(61,68,83)` , `background: rgb(255,255,255)` , `border: rgb(159,182,221)` , `text-decoration: none` . Not red, not underlined, visibly a control. The screenshot’s bordered sub-panel also lost its “Applying for this clearance” heading (:805–813); what remains is the one useful line, “Its form still needs finishing — Apply opens it.”

What’s left: Nothing for the named control.

Risk/Notes: ⚠ **Its sibling on the same grid was not converted.** “Remove the {clearance} copy” (:883–892) is still `text-s-red` underline — **OBSERVED** `color: rgb(193,18,18)` , `text-decoration: underline` — the exact treatment item 107 objected to, on a card where nothing has gone wrong, sitting inside a green success panel. If the tester meets a held-copy card they will very likely file item 107 again against this button.

Item 108 DONE

Checklist: Application form for Zoning / Locational Clearance is missing.

Evidence: Duplicate filing of item 101. ZoningFields at OfficeFormStep.tsx:505–687 , registered :93–100 and PermitType.php:50 , rendered :1124 . **Observed live;** the API returns derived data (`ZONING {“application_type”:“New Locational Clearance”,“site_tenure”:“Owned or occupied by the applicant”,...}`).

What’s left: Nothing.

Item 109 DONE

Checklist: Application form for Market Clearance is missing; create one, since no paper version exists.

Evidence: MARKET is in OFFICE_FORM_CODES (PermitType.php:50 , OfficeFormStep.tsx:99). MarketFields (:999–1096) asks three questions: Name of Market (required), Stall No. (required), Number of Stalls Held (optional, whole number ≥ 1). officeFormMissing enforces the two required (:218–226). The sheet admits its provenance rather than faking a form code — OFFICE_FORM_META.MARKET.ref = ‘Interim form – the office has no printed version of this application’ (:157–161). application_type derived server-side (OfficeFormController.php:294–305). **Observed live:** renders with that ref line and “Still needed on this form: Name of Market, Stall No.”

What’s left: Sign-off from the City Market Administrator on the three invented questions, then delete the interim ref line. questions-for-malabon.md A9b (line 171), A9c (line 241).

Risk/Notes: ⚠ A real functional gap sits behind this sheet: **stall_count is collected here but never reaches applications.fee_profile** , so the four seeded `basis='stall_count'` fee rules stay permanently unmatched and a multi-stall holder is **under-billed**. Documented at OfficeFormStep.tsx:990–997 and HANDOFF §6.3; written up rather than half-done, which is right, but open.

Item 110 **PARTIAL**

Checklist: Renewal must ask first, in a modal, for the permit ID.

Evidence: “First, in a modal” half done (`ApplyWizard.tsx:1302` , opened `:1745` before the wizard renders). The “permit ID” half is satisfied by **selection, not entry**: business `<select>` (`:1319–1334`) then a permit radio list (`:1368–1370`). **There is no field to type or paste a permit number.** Two consequences: (a) a permit belonging to a *different* owner or issued on paper cannot be quoted at all — `:1355–1366` routes those applicants to “This business has no permit issued through BizTrack yet. Carry on, and upload your paper permit under Documentary Requirements”; (b) `FieldLabel` required on the permit question is conditional — `required={applicationType === 'renewal' && permits.length > 0}` (`:1345`) — so a renewal with an empty permit list proceeds with `prior_permit_id = null` , which `PriorPermitController.php:51–52` explicitly allows. `059e4a7` fixed the business list being capped at one page (`resources.ts:215–216` , `PICKER_PAGE_SIZE = 200` `:122`).

What’s left: If the tester means a typed permit-number lookup like the BPLS screen, add a permit-number input that resolves to a permit (and lets a paper-permit holder identify themselves). Confirm the intended identifier first — `SA20` (`:367–372`) and `SE3` (`:840–842` , “The renewal form, or the BPLS renewal screen — We have never seen it”) both open.

Risk/Notes: Items 50 / 85 / 110 are one requirement escalating. 50 and 85 are met; only the literal “ask for the permit ID” reading of 110 is not.

Item 111a **PARTIAL**

Checklist: View/download of uploaded file not working (admin side).

Evidence: The endpoint works and is correctly scoped. **Live** `GET /documents/32/download` as `sanitary@biztrack.local` (app 18, CHO routed) → **200**, `content-type: image/jpeg` , `content-length: 79727` , correct `content-disposition` . A document on an application sanitary is *not* routed to → **403**. `DocumentController.php:133–137` checks `ApplicationVisibility::canView` rather than the bare permission (comment `:125–132`), `:139` returns 404 “File not found.” when the blob is gone. Blob masking handled (`resources.ts:144–157` , `:164–188`).

What’s left: `37 of 214` document rows in `e2e.sqlite` (the DB the running API actually uses) and **49 of 170** in `database.sqlite` point at files that do not exist under `api/storage/app/private/` . Contiguous and recent — applications **3378, 3380, 3384, 3385, 3386, 3387, 3389**, uploaded 2026-08-03 onward. A search of the whole `api/storage` tree for one UUID found nothing. **Every View/Download on a tester-uploaded document therefore 404s.** Find out where those uploads went before telling the tester this is fixed.

Risk/Notes: An earlier automated pass reported “0 of 170 files present” — **that was wrong**; disk `local` roots at `storage/app/private` (`api/config/filesystems.php:33–39`), so `private/documents/...` correctly resolves to `storage/app/private/private/documents/...` . The real number is 37/214 missing, and they are exactly the tester’s own uploads, **which is why the tester saw it and we did not.**

Item 111b PARTIAL

Checklist: After approving an application it still shows approval.

Evidence: The UI hides the controls: `ReviewPage.tsx:639-641` — `rejected || approvedHere || Boolean(data.completed_at) → decided`, and editing requires `!decided (:643); approve() calls reload() (:696-698)`. **△ The API has no guard:** `AssignmentController.php:253-264` runs `authorizeDepartment`, validates only `remarks`, then calls `workflow->approveAssignment()` **unconditionally**; `WorkflowService.php:177-186` re-sets the assignment to `Completed` and **re-runs** `afterReviewProgress()`. A stale tab, a double-click, or a replayed request re-fires the whole approval chain.

What's left: Add a status guard in `AssignmentController::approve()` — `abort_if($assignment->status === AssignmentStatus::Completed, 422, ...)` — so the API is idempotent rather than relying on the button being hidden. Same for `return()` at `:266-281`.

Item 111c DONE

Checklist: Other requirements from other accounts in other offices show up.

Evidence: Re-verified live, not taken on the handoff's word. `OfficerRequestController.php:113-155`: `view_any_office` sees all; a scoped office matches `requested_by_user_id = me OR department_id = mine (:145-151)`; everyone else only their own applications. **Live** `GET /requests`: **sanitary 38, bplo 125, market 0** — matching the DB exactly (`officer_requests` total 125; `department_id=2` → 38). Under the *previous* rule the same DB gives sanitary **116**, fire **116**, zoning **47** — so the fix removes a **78-row leak for sanitary alone**. Closing separately gated `:296-304`. Landed 816a1b6.

What's left: Nothing.

Risk/Notes: **△ Correction to HANDOFF §4.3:** “sanitary now sees 38, bplo sees 125” are **officer-request** counts, not application counts. §4.3 reads as though application-level separability was verified at 38/125; it was not. Application-level counts today are sanitary **1,295** / bplo **1,832**.

Item 111d DONE

Checklist: Messages from other officers in other offices show up.

Evidence: `MessageController::scopeMessagesToReader()` `:68-102` — a scoped office reads the applicant's turns (correlated subquery `:86-90`) plus its own officers' turns (`:95-100`), and adds no clause at all when it has no department, so it **fails closed**. Applied to the transcript *and* its count (`:409-425`), the inbox preview and counter (`:139-149`), and thread existence so an empty thread does not appear as a silhouette (`:165-177`). **Live on application 3377**, whose thread holds 8 turns from three offices (CENRO×4, BPLO×3, CMO-MARKET×1): **sanitary** → **0**, **market** → **1**, **id [1559]** (its own), **cenro** → **4**, **ids [1550,1551,1556,1562]** (its own), **bplo** → **8**, **all**. Landed 816a1b6.

What's left: Nothing.

Risk/Notes: Deliberate trade documented `:60-66` — BPLO's and the super admin's turns are hidden from a scoped office too. If the LGU wants BPLO's coordination visible in-thread, that is one added clause, not a redesign.

Item 111e NOT DONE

Checklist: Form submissions for other offices are still present in one office/admin account.

Evidence: ⚠ **The dedicated endpoint is fixed; the path the review screen actually uses is not.**

`OfficeFormController::readableCode()` :354–368 scopes a sheet to the permit type's `issuing_department_id`, and it works — **live** `GET /applications/18/office-forms` (a filing routed to all seven offices, holding four sheets) returned `[SANITARY]` for sanitary, `[MARKET]` for market, `[CEC]` for cenro, all six for bplo.

What's left: Filter `office_forms` in `ApplicationResource` by the same issuing-department rule `readableCode()` already uses — **the rule exists, it is just not applied here**. Then decide and apply the same for `inspections[].findings` and `assignments[].remarks`. The tester's acceptance sentence is literal: *"Every datum recorded ONLY for the Market admin account must not be displayed in the Sanitary admin's account"* — `owner_birthday` on a CENRO sheet reaching a CHO officer fails it today.

Risk/Notes: ⚠ **This is the highest-value remaining item in the batch.** 111c and 111d are genuinely closed and provable; 111e is closed only on the endpoint nobody's review screen calls. The handoff does not claim 111e was fixed, and the code comments at `OfficeFormController.php:330–353` read as though it was — **that gap is how this survived**.

Item 112 PARTIAL

Checklist: Remove unnecessary, AI-sounding, long explanations across the GUI.

Evidence: A pass happened — `3743ca5` "say it once and stop" (08-05), 6 files, ~559 characters of visible prose removed, deliberately sparing RA 10173 consent and analytics provenance. **Worst survivors, for the user to rule on (not rewritten):** 1. `web/src/components/ui/Proto.tsx:233` — *"If you believe this action was taken in error, please contact support for further review."* Generic-SaaS phrasing on a government portal, and "support" is not a thing an LGU applicant can contact. Paired with `:230` *"This account has been {word} and access to the platform has been restricted."* 2. `AnalyticsDefinitions.php:253` — a four-sentence covers string ending *"...which is why the reviews behind the chart add up to less than the window's total."* 3. `AnalyticsDefinitions.php:449` — three-sentence `why` on cohort survival ending *"...counting it as a success would flatter the figure while counting it as a failure would be a false accusation."* 4. `ProcessingTimePage.tsx:142–149` — two stacked paragraphs both explaining the shaded band; the second restates the first. 5. `ProfilePage.tsx:484` — *"When an application is approved and the permit is issued, your business and its permits appear here to view or save as PDF."* 6. `ProfilePage.tsx:521–523` and `SettingsPage.tsx:354` — the same email-is-your-sign-in-ID explanation written twice in two places. 7. `OfficeFormStep.tsx:628` — `hint="Names your lessor when the premises are rented. Attach the matching land title or lease contract with your documents."` 8. `RequestsPage.tsx:296` — *"You can keep adding responses until this office closes the request."*

What's left: User decides which are "not that important". ⚠ Items 2–4 sit against item 102 and §7.4: **the analytics prose is load-bearing disclosure** (it names denominators and exclusions), so cutting it trades honesty for brevity.

Risk/Notes: Do not cut `meta.computed_at` (§7.4) or the RA 10173 consent copy while trimming.

Item 113 PARTIAL

Checklist: Remove unnecessary placeholders, especially ones that look like real data.

Evidence: Named defect fixed. a525c05 (08-05) replaced every value-shaped placeholder with a shape: e.g. 0917 123 4567 → 11 digits, starting 09 (ApplyWizard.tsx:4656, :4717), e.g. 8281 4999 → Area code and number (:4132), e.g. alingnenas.com.ph → yourbusiness.com.ph (:4152), e.g. Juan Dela Cruz → Full name. Also stripped label-repeating placeholders from First/Last/Middle Name, Email, Password, Re-enter Password in RegisterPage.tsx. ⚠ TWO SURVIVORS of that same sweep, both the “label repeated in grey” pattern the commit says it eliminated, both in files the commit touched: - web/src/pages/auth/RegisterPage.tsx:306 — placeholder="Contact Number" under <Field label="Contact Number" required> at :300. - web/src/pages/SettingsPage.tsx:392 — placeholder="Current Password" under <FieldLabel>Current Password</FieldLabel> at :388. Neither is caught by the guard: apply-wizard.spec.ts:544 only visits wizard part 2 and its regex does not match “Contact Number”.

What's left: Delete the two placeholders. Optionally extend the e2e placeholder assertion to register and settings pages.

Risk/Notes: Minor inconsistency: SettingsPage.tsx:341 uses the mask 09XX XXX XXXX while the wizard uses prose 11 digits, starting 09 for the same fact. Both are shapes; they differ.

Item 114 NOT DONE

Checklist: Draw a 500 m radius circle on the location-insights map.

Evidence: web/src/components/MapPicker.tsx is the only map on the zoning step and renders exactly a TileLayer, a ClickCapture and one Marker (:83–96). Imports MapContainer, Marker, TileLayer, useMap, useMapEvents (:2) — **no Circle**. Across the whole frontend the only react-leaflet imports are MapPicker.tsx:2 and AnalyticsPage.tsx:3 (CircleMarker — a fixed-pixel marker on the admin map, not a metre-radius overlay). The insights panel renders inside the zoning modal (ApplyWizard.tsx:5238–5242) with no map of its own.

What's left: Add <Circle center={[lat,lng]} radius={insights.radius_m} /> to MapPicker when a pin exists, driven by the API's radius_m rather than a hardcoded 500 (the panel already sources it — LocationInsightsPanel.tsx:179). Two decisions: whether it shows on the zoning picker (where the pin is dropped but insights are not yet fetched — insightsQuery is only set on next(), :2875) or requires a second map inside the modal; and the stroke/fill must not read as a zoning boundary, since no zone polygons exist.

Risk/Notes: If the circle goes on the picker, MapPicker currently zooms to 16 when a pin exists (:85), at which point a 500 m circle overflows the 320 px viewport — zoom would need to drop or the map to fitBounds the circle.

Item 115 **PARTIAL**

Checklist: Line of business should only be one — no multiple selection.

Evidence: Mechanism correct — `ApplyWizard.tsx:846-851` `toggle()` replaces rather than appends and closes the list; re-clicking selected row is a no-op. Rows `role="radio" + aria-checked` (:977-978) inside `role="radiogroup"` (:938-939). Rationale + 733/728/5 usage figures at :828-844 . Commit `b2d0942` . TWO GAPS: 1. **Visible copy still asks for several.** :4446-4447 directly above the picker: “Add every line you trade in — each one is assessed separately.” `git show b2d0942` confirms the single-select commit never touched this string. Confirmation bar and panel also still read `Selected (N)` (:929 , :1034), phrasing built for multi-select. 2. **API does not enforce it.** `BusinessController.php:403` — `'lines' => ['required','array','min:1']` , no `max:1` . Single-select is browser-only; a direct POST or a renewal restoring a legacy two-line business still yields multiple `business_lines` , and `LinesStep` renders both (:1036) with no way back to one except two Removes.

What's left: (a) Rewrite :4446-4447 to singular; consider dropping (N) from :929 / :1034 . (b) Decide on server-side `max:1` — must not break the 5 existing two-line businesses on renewal.

Risk/Notes: Conflicts with item 106's shape: capital and category still collected per line (`FeeProfileStep.tsx:940-1019`), correct only while the array holds one element. Stale comments assert old behaviour at :124-125 and :4433-4435 — three claims now false.

Item 116 **PARTIAL** (a) DONE, (c) DONE, (b) NOT DONE

Checklist: (a) remove “These figures are not part of the zoning decision.”; (b) clarify “Straight line, not walking distance”; (c) make “Most common line of business” more specific than “15 of 48”.

Evidence: (a) Removed in `b2d0942` (Aug 5 17:20), which cites “checklist item 112” — an earlier filing of the same request. The `<p>` is gone; only the replacement comment stands at `LocationInsightsPanel.tsx:285-299` .

Removing it is currently safe. The safeguard's stated condition is that the CPDO line must remain in the zoning modal, and it does: `ApplyWizard.tsx:5233-5236` renders “The Zoning Office (CPDO) makes the final determination on your zoning clearance during processing.” directly above `<LocationInsightsPanel>` (:5238), inside the same `ProtoModal` . The deny variant carries the same sentence (:5184). So the tester's request and the safeguard do not conflict today. (b) `LocationInsightsPanel.tsx:270` still reads exactly `'Straight line, not walking distance'` , unchanged since `fd7fa3c` . Nothing on screen explains what it means. The reasoning lives only in comments (:15-19 , and `LocationInsights.php:156-160` — “320 m' that turns out to be a 900 m walk around a river is worse than no figure”), which the applicant never sees. (c) Fixed in `b2d0942` : `LocationInsightsPanel.tsx:255-258` now renders `` ${count} of the ${of_total} businesses near this pin`` — the §8.7 “name both numbers” rule applied.

What's left: Only (b). Reword :270 into something an applicant decodes without a glossary — e.g. “Measured in a straight line, not along roads”. §8.7 “say it once” means the replacement must stay one short qualifier, not a sentence explaining haversine.

Risk/Notes: The Aug 2 (item 68) and Aug 5 (item 116) screenshots differ because `fd7fa3c` rewrote every label and `b2d0942` removed the disclaimer and expanded the “15 of 48” note. Item 116 was filed against the Aug 3 build; two of its three asks were already landed by Aug 5. △ If (a) is ever revisited, the guard to check is `ApplyWizard.tsx:5233-5236` — if that CPDO paragraph moves or is deleted, the disclaimer must be restored.

Item 117 **CANNOT VERIFY** *analysis only, no action taken*

Checklist: Clean the database; remove old dummy data violating the new validations.

Evidence: Read-only PDO inspection. 797 businesses (734 live, 63 soft-deleted), 1,710 applications, 4,125 permits, 84 users.

Rule	Source	Live rows failing
<code>tin</code> regex (required)	<code>BusinessController.php:382</code>	1 — business id 4, <code>tin = "aaa"</code> . 0 null/empty.
<code>registration_number</code> regex + <code>min:4</code>	<code>BusinessController.php:379</code>	8 — ids 4 (111), 10 (123466+59556), 13 (111), 14 (jshdjaksdkjas), 24 (111), 1532 (Test), 1560 (hjsagjhdghjas), 1561 (11); 4 shorter than 4 chars. 0 null/empty.
PH mobile pattern	<code>web/src/lib/validation.ts:11</code> (client only — server is <code>['required', 'string', 'max:20']</code>)	<code>users.mobile_number</code> : 0 failing. <code>businesses.emergency_contact_number</code> : 8 failing (e.g. 12345678900 , 1111111111 , 812381382138), 755 null. <code>business_addresses.telephone</code> : 1 failing (12333333), 789 null.
Future birthdates	—	Rule does not exist. No <code>birth*</code> / <code>dob</code> column in any of the 47 tables. Nothing to count.
Future-dated rows	—	0 across <code>businesses/applications/permits/users</code> .
Businesses with null/missing owner	—	0 missing <code>users</code> row; 0 live businesses whose owner is soft-deleted.
Soft-delete leaks (§14.2)	—	146 applications point at a soft-deleted business (handoff said 139); 357 permits hang off a soft-deleted business; 0 applications point at a missing row.
Structural gaps	—	39 live businesses have no <code>business_owners</code> row; 0 missing addresses; 0 missing lines.
Lat/Ing	—	0 null coordinates; 0 outside a Malabon bounding box.

What's left: A user decision. ~9 live business rows carry obviously-fake `tin` / `registration_number` (ids 4, 10, 13, 14, 24, 1532, 1560, 1561), 9 contact numbers fail the client mobile pattern, and 146 applications + 357 permits reference soft-deleted businesses.

Risk/Notes: ⚠ **I deleted nothing and will not.** `api/database/database.sqlite` holds **real tester data filed by Malabon City Hall staff** (HANDOFF §2.1: “Never delete rows you did not create”), and the dev API, the demo API

on :8082 and the public tunnel all read and write this one file (`scripts/demo-up.sh:13`). Any deletion must be an explicit user decision taken outside a live tester session, with a file-level backup first. Note the 146/357 soft-delete references are **already handled in code** by `businessName()` returning “Business removed from register” (§14.2) — deleting them would destroy audit history rather than fix a defect.

Item 118 **PARTIAL**

Checklist: Remove long paragraph under Tax Classification; no underscores in Revenue Code choices.

Evidence: First half — shortened, not removed. `git log -S"one trade can fall under several"` dates it to 3743ca5 (08-05, “say it once and stop”). The exact quoted sentence is gone but a three-line paragraph remains at `FeeProfileStep.tsx:929-933`: “*Not the line of business again — the Revenue Code bracket it is taxed under. A carinderia and a franchised fast-food branch are both food, at different rates. Type the closest match; the reviewing officer checks it.*” Same argument, ~40% shorter, still `aria-describedby` -wired to every category input (:977–981). **Second half — not done**, underscored slugs remain (see Item 63).

What’s left: (a) Decide whether the remaining paragraph goes entirely — field label is already “Tax Classification (Malabon Revenue Code)” (:928) and the input “Revenue Code category” (:966), so the paragraph is the second saying. (b) Humanize option labels (Item 63).

Risk/Notes: ⚠ If the paragraph is deleted outright, `aria-describedby` at :977–981 must be repointed or the `fee-category-help` id dangles, leaving the error-only branch as sole description — a WCAG 3.3.2 regression on a required field. Doing Item 63 first makes the paragraph easier to justify cutting.

Item 119 **PARTIAL**

Checklist: What is “Copy on file”? (panel shows a raw filename)

Evidence: The term IS defined. “Copy on file” is the chip for `state === 'submitted'` (`ClearanceStagePage.tsx:90`) meaning a certificate the applicant already holds and uploaded instead of applying for. Explained by the green panel directly under it, “On file, not applied for” (:869–872), by the rule sentence above the grid (:715–720), and at length in the SUBMISSION dialog before upload (:1039–1043). **OBSERVED live:** badge `color: rgb(34,181,115)` on green tint, `title` attribute **null** — no tooltip, and no definition sits next to the badge on an untouched card. ⚠ **The defect the screenshot actually shows is unfixed.** `held_document.name` is `documents.original_filename` verbatim (`ClearanceService.php:158`) printed straight into the panel at :873–875 as `{held.name} · {formatBytes(held.size)}`, with nothing but CSS `truncate` and a `title`. **OBSERVED** after uploading a copy to the CEC clearance: the panel rendered `41442-3840x2160-desktop-4k-google-background-image.pdf · 69 B` — the same class of string as the tester’s screenshot.

What’s left: (1) Lead the panel with a human label — “Your City Environmental Certificate — 69 KB” — and demote the filename to secondary text, a tooltip, or the text of a download link (`download_url` is already on the payload, `ClearanceService.php:160` , **currently unused by this panel**). (2) Give the “Copy on file” chip a definition reachable from the grid — a `title` , or one clause on the chip’s own card.

Risk/Notes: The panel offers no way to open or check what was uploaded, so the filename is currently the *only* signal that the right file went in — which is why removing it outright would be worse than leaving it. **Fix by adding the download link, not by deleting the string.**

Item 120 **PARTIAL**

Checklist: Return the Market Clearance card; it is the only one not required, meaning the other five ARE required.

Evidence: Card is back and optional. `const visibleRows = rows` at `ClearanceStagePage.tsx:605` — no filter, every clearance renders (commit `b2d0942`). **OBSERVED live:** all six cards render, Market included, carrying “Optional — only if you trade from a stall...”. **△ The “other five are required” half is NOT implemented, in either layer.** In the wizard the rule is at-least-one-of-six: `anyClearanceDecided` uses `.some` and names no code (`:315–317`), so a filing satisfies the step with Zoning alone and five cards untouched. `ApplyWizard.tsx:2249–2255` refuses to name codes on purpose, pending A1. Server-side nothing is required at all — **OBSERVED:** submit with all six `available` returned 200 / `pending_payment` / BIZ-2026-00479 . So **all six can be skipped through the API and five of six through the UI.**

Risk/Notes: Items 5 / 98 / 109 / 120 reconcile cleanly against the current code, and none is superseded: 5 (no Mayor’s card, Zoning present) holds; 98 (Market not required) holds and was never in conflict with 120, since 120 also calls Market optional; 109 (create the Market form) holds; 120’s *visibility* half is the later of the two Market rulings and is in force — Market is shown-and-optional, and HANDOFF §6.2’s “do not reintroduce conditional hiding” is the correct standing instruction. The only genuinely open thing across the four is 120’s “other five are required”, which no earlier item contradicts because no earlier item asked for it. **Independently of A1, the server-side gap under item 76 should be closed regardless of which way City Hall answers** — today the API accepts a filing with zero clearances.

Item 121a **NOT DONE** (and, as scoped, *BLOCKED* (LGU))

Checklist: Business Owner — pinning of location still works on water.

Evidence: `ApplyWizard.tsx:222–237` defines `MALABON_BOUNDS` (14.645–14.7, 120.93–120.985) and `withinMalabon()` ; enforced on pin drop `:4485` and step validation `:2390` . That is a **rectangle**, and the code says so at `:210–220` : “it does not prove the pin is inside the city limits ... and it does not detect water. Malabon is a river delta — the Tullahan, the Tenejeros-Tanza and the fishpond belt run through it — so ‘not on water’ cannot be answered without a coastline or hydrography layer... Neither exists here.” Server-side there is **no geo constraint at all**: `BusinessController.php:387–388` accepts `between:-90,90` / `between:-180,180` . `MapPicker.tsx` has no bounds logic of its own.

What’s left: Needs a hydrography/coastline layer or the city boundary polygon — both outstanding City Hall requests: §C6 (`:620`) and §C8 (`:637`). Once a GeoJSON exists, add point-in-polygon in `withinMalabon()` and **mirror it as a server rule.**

Risk/Notes: A partial water check that silently passed most pins would be worse than none — it would put the city’s name behind a guarantee nobody made. **Recommend against a hand-drawn approximation.**

Item 121b NOT DONE

Checklist: All admin accounts — view/download of uploaded file fails with “file not found”.

Evidence: △ **Not a masking bug — the files are genuinely absent from the storage root the API reads.** The admin path is already correct: `officer/ReviewPage.tsx:221` → `DocumentActions.tsx:61,76` → `viewBlob / downloadBlob` → `rethrowBlobError`, and `document-actions.spec.ts:26` exercises `/staff/queue/6` asserting the server’s own refusal text appears rather than “Something went wrong”. Read-only disk audit against the exact disk root (`api/config/filesystems.php:35` → `api/storage/app/private/`), 170 `application_documents` rows: `mainOnly=121 demoOnly=49 both=0 neither=0 => demo API (tunnel, :8082) 404s on 121 of 170 => dev API (:5173/:8000) 404s on 49 of 170`

What’s left: Make the two APIs share one storage root — set the filesystem root via env in `demo-up.sh` the same way `DB_DATABASE` is set, or symlink `biztrack-demo/api/storage/app/private` at the main tree. Then reconcile the 49 orphaned files by **copying** them into the main tree (a copy, not a move — no deletion).

Risk/Notes: Same defect explains item 65. △ **Do not “fix” this by rewriting `stored_path` values in the database — the paths are correct; the root is not.**

Item 121c PARTIAL

Checklist: BPLO-handled messages visible to all admin accounts; separability should apply.

Evidence: Department separability **is** implemented for the six office roles: `MessageController.php:68–102` (`scopeMessagesToReader`) restricts a scoped office to the applicant’s own turns plus turns from senders in its own `department_id` (`:86–100`), applied to `inbox` (`:143,149,207`), one thread (`:414,417`) and attachments (`:508`). Thread list additionally scoped by `ApplicationVisibility::scope` `:163`. Covered by `OfficeScopingTest.php:422–449, 451–472, 474–494, :177–189`. △ The gap is the documented exception at `:70–72`: `if (ApplicationVisibility::readsEveryOffice($user)) return;` — **no scoping at all** for any holder of `application.view_any_office`, i.e. `bplo_staff` and `admin` (`RbacSeeder.php:63–72, 107–118`; `ApplicationVisibility.php:35–38`). So the super admin sees BPLO’s turns and BPLO sees everyone’s. Comment `:60–66` states this was a deliberate trade: “BPLO is another office by this rule and the client named no exception for it.”

What’s left: Decide whether the super admin should be scoped out of BPLO threads. Per `:65–66` that is “one added clause here, not a redesign”. **Needs the tester to say which pair of accounts they observed** — “all admin accounts” is ambiguous between the six office admins (already scoped, correctly) and the two full-read seats (deliberately unscoped).

Risk/Notes: Ties to §B3 (`:447`), unanswered.

Item 121d NOT DONE

Checklist: Super admin should have processing-time monitoring **ONLY**.

Evidence: Every analytics endpoint sits behind the single gate `permission:analytics.view` — `api/routes/workflow.php:184–238` covers `summary` (`:186`), `export` (`:187`), `dashboard` (`:202–203`), `processing-time` (`:204–205`), `business-growth` (`:206–207`), `renewal-risk` (`:214–215`), `refresh` (`:228–229`). **There is no separate gate for processing-time.** Frontend `AnalyticsTabs.tsx:12–21` is a static four-entry array with no role check; `nav.ts` gates only whether the Analytics entry appears. Result: `admin` reaches **all four** tabs.

What’s left: If accepted, introduce a second permission (e.g. `analytics.processing_time`) or split the route group, and filter `TABS` by permission.

Risk/Notes: See 121e — 121d and 121e together contradict the design the tester themselves asked for in item 78.

Item 121e NOT DONE and it conflicts with item 78

Checklist: BPLO admin should NOT have processing-time monitoring; only the three dashboards.

Evidence:  `bplo_staff` holds `analytics.view` (`RbacSeeder.php:71`), granted **specifically in response to tester checklist item 78** — the seeder comment `:45–62` records it verbatim: *“the dashboard should be transferred to BPLO admin, not super admin.”* Because all seven analytics routes share one gate and the tab list is static, `bplo_staff` and `admin` today see an **identical** four-tab surface. The other six office roles hold no analytics permission and see nothing.

What’s left: A product decision before any code. 121d asks the super admin to lose Overview / Renewal Risk / Lifecycle; 121e asks BPLO to lose Processing Time; **item 78 asked for the dashboards to move to BPLO**. Taken together the tester describes a clean split — BPLO gets the three dashboards, super admin gets processing-time only — but 121d as literally written would also strip the super admin of the analytics CSV export and `refresh`, and `AnalyticsController.php:53–59` documents why the aggregates are restricted to full-read seats in the first place.

Risk/Notes: Flagging the contradiction rather than resolving it. Confirm the intended split with the tester (§B12 `:542` — “Who is the super administrator in practice — MISD or BPLO?” — is unanswered, and is the same question underneath).

Appendix A — Cross-item analysis

the 26-vs-113 tension (resolved — they do not conflict)

They govern different UI elements and the code satisfies both. **113 is about placeholders** — grey text in an empty field, which a tester can mistake for entered data; rule from `a525c05` and HANDOFF §5.5 is *show the shape, never a value*.

26 is about error messages — text appearing only after a wrong answer, impossible to mistake for the user's own input, and where naming the fault is a WCAG 3.3.1/3.3.3 obligation. So `validation.ts:44` legitimately contains a full 11-digit example while the placeholder two elements away legitimately does not. The incident HANDOFF §5.5 records is a *third* thing: item 70 asked for realistic examples over masks, the author over-corrected a placeholder into e.g. `0917 123 4567`, and the tester read it as a real number. That was **item 70 colliding with item 113**, not 26 with 113 — `a525c05`'s body says so ("Right diagnosis, wrong cure"). The genuine residual is the opposite of a conflict: **item 26 was only ever applied to the auth pages**. The wizard's three phone fields still carry a flat format-restating error and a `phoneValid` loose enough to accept `000000000000` — and the API accepts it too (observed 422 omitting `mobile_number`).

Appendix B — Corrections this audit produced

Auditors were instructed to treat the project’s own documents as leads rather than proof. Several turned out to be wrong or stale. Recording them here because each one would mislead the next person who trusts it — including a future reader briefing City Hall.

Documents that contradict the code

Where	What it says	What is true
docs/HANDOFF.md §5.2	“135 PSIC codes seeded; the picker shows 136 options (135 + the ‘Other’ affordance)”	135 rows including Other, so 134 real trades, and the picker renders 134 because Other is filtered out. Both numbers were wrong. The same off-by-one is repeated in code comments at <code>FeeProfileStep.tsx:920–921</code> and <code>ApplyWizard.tsx:4433</code> .
docs/HANDOFF.md §4.3	“sanitary now sees 38, bplo sees 125” presented as proof of application-level separability	Those are officer-request counts, not application counts. Application-level counts are sanitary 1,295 / bplo 1,832 . The separability claim is still true; the figures cited for it belong to a different fix.
docs/HANDOFF.md §14.2	“139 applications pointed at soft-deleted businesses”	146 today, plus 357 permits hanging off soft-deleted businesses.
docs/questions-for-malabon.md §E1	“we have still never seen” the BPLO counter form	The intake is transcribed from those forms, carrying their own lettered item references (<code>fa3f107</code>). Asking BPLO again for forms they already provided would not go down well. §A19’s identical claim about the amendment form is still accurate — that one genuinely has not been seen.
docs/questions-for-malabon.md §A13	“we added an ‘Other (not listed)’ option that takes free text”	Removed by <code>76aa6bb</code> two days later, because the <code>00000</code> row carries a NULL revenue-code category and 35 of 36 business-tax rules match on that category — a line filed under Other was assessed no business tax at all .
docs/api-contract.md:132	describes the receipt endpoint as a “watermarked ‘SIMULATED PAYMENT’ receipt”	The watermark was removed in <code>fd7fa3c</code> .

Where	What it says	What is true
docs/api-contract.md:157–161	“hiding them only in the UI would leave them in the network tab, so the filtering is in <code>ApplicationResource</code> ”	Does not hold on <code>PaymentController::fee</code> , which returns <code>line_items</code> raw — including <code>section</code> and <code>source</code> — and is exactly the endpoint the applicant’s Pay page calls.
docs/testing-checklist-status.md:18	marks item 6 “Already fixed”	Covers the first sentence of item 6 only; the second sentence was never addressed.

Code comments that describe behaviour the code no longer has

The most dangerous of these is the first: it actively instructs a reader toward the bug the handoff warns against reintroducing.

- **ClearanceStagePage.tsx** — :566–584 describes a `.filter` that no longer exists; :601–603 references a `marketShown` variable that is gone; and :711–713 states “item 98 keeps the one such card off the grid entirely”, which **directly contradicts** :605 (`const visibleRows = rows`). A reader trusting these comments would conclude the Market card is hidden and could “restore” the conditional hiding that §6.2 forbids. `marketClearanceApplies` and `MARKET_CATEGORIES` remain exported with **zero call sites**.
- **ApplyWizard.tsx:721–725** — still describes the removed “Other (not listed)” free-text row, 25 lines above the code that filters it out.
- **ApplyWizard.tsx:124–125** and **:4433–4435** — claim multi-select, capital per line, and a free-text escape. All three are now false.
- **LoginPage.tsx:59–61** — promises “the typed credentials stay” on the cross-portal hop. True when the fix was a client-side reconcile; false since `ea2765c` made it a full page navigation, which clears them.
- **QueuePage.tsx:365–368** — justifies a hidden search label because “the magnifying-glass context is obvious visually”. There is no magnifying glass; neither Track page renders one.
- **AnalyticsPage.tsx:104–105** — says valid markers are radius 3.5; the code is 4.5.

Tests and controls that do not do what they appear to

- **NotificationLinkTest.php:47** looks like a guard against dead notification links but is effectively vacuous — `RefreshDatabase` against `:memory:` means it inspects seeded rows, never the tester database where the 41 dead links actually live.
- **DraftsPage.tsx:79–86** renders a trash button, `aria-label="Delete drafts"`, with **no `onClick`**.
- **SettingsPage.tsx:247–249** renders “Edit Profile Picture” with no handler, no file input, and no backend column anywhere in the schema.
- **Five pages** render a props-less `<SortFilter />`, which is documented “static ornament” mode — it looks like a control and does nothing: `RequestsPage`, `admin/UsersPage`, `admin/OwnersPage`, `officer/InspectionsPage`, `applicant/DraftsPage`.
- **ApplyWizard.tsx:3722** uses `disabled` on the wizard step chips, which violates the project’s own accessibility rule (§8.5, “never `disabled`” — screen readers skip it entirely).

A correction to this audit itself

An early automated pass reported “0 of 170 document files present on disk”, which would have meant total storage loss. That was **wrong**: the `local` disk roots at `storage/app/private`, so a `stored_path` of `private/documents/...` correctly resolves to `storage/app/private/private/documents/...`. The real figures are 121/49 split across two

worktrees, and 37 of 214 genuinely missing in the e2e database. Recorded because the alarming number reached a draft before it was checked.

Appendix C — The same complaint, refiled

Six checking rounds over thirteen days re-observed many of the same defects. Grouping by root cause is what turns 121 line items into a workable list. Where a cluster is fully closed, one fix closed every filing in it.

Cluster	Items	Status
Approved permits: Track → Profile	1, 40, 44, 61, 74, 79, 81, 93	Closed except 44 (officer queue, deliberate) and 1 (avatar button)
Other Requirements page	13, 19, 57, 65, 83, 89, 100	Page itself is sound; 65 is the storage split, 100 is the tunnel, 89 needs a decision
Line of business / PSIC	3, 62, 63, 67, 69, 91, 104, 106, 115, 118	Closed except 63/118 (underscored slugs) and 115 (copy + server rule)
Office separability	56, 111c, 111d, 121c	Requests and messages provably closed; form answers are not (111e)
File view / download	55, 65, 96, 111a, 121b	One root cause: two storage trees, one database
Receipt and Tax Order of Payment	18, 25, 48, 58, 75	Rendering fixed and proven; 18 blocked, 75 needs your ruling
Amendment and renewal forms	50, 52, 82, 84, 85, 110	Renewal closed; amendment blocked on the paper form
AI-sounding copy	30, 31, 68, 112, 116, 118	Largely closed; remaining offenders listed under 112
Step order and flow	2, 33, 34, 69, 71, 97	Settled at 7 steps; 33 vs 71 needs confirming
Chatbot	7, 37, 41	All three closed and verified by running the tester's own sentence
Drafts	14, 32, 36	All closed — autosave is server-side, 44 drafts in the database prove it
Sort / filter / search	8, 88, 90	Track pages done; payment history truncates at 50; five ornamental controls remain
Staff login separation	24, 42, 77	Closed, enforced server-side with a 409
Market Clearance	5, 98, 109, 120	Visible and optional as intended; "other five required" needs A1
Email verification	28, 29, 99	Banner removed safely; nothing is actually delivered (B4)
Placeholders	26, 66, 70, 113	Closed except two survivors and the wizard's phone fields

Cluster	Items	Status
Pin on water	86, 121a	Rectangle bounds only, client-side only; needs a hydrography layer
Super admin vs BPLO dashboards	78, 121d, 121e	78 done; 121d/e contradict it

Appendix D — What I would do first

Ordered by consequence, not by effort. Nothing in this list was started.

1. **Item 111e** — apply the existing issuing-department rule to `office_forms` in `ApplicationResource`, then decide the same for inspection findings and assignment remarks. This is the one open item that leaks one office's data into another's screen, and the rule to apply already exists a file away.
2. **Items 65 / 111a / 121b** — give the demo and dev APIs one storage root, then copy the orphaned files across. Until this is done, testers cannot open their own uploads, and any further testing of document handling produces false failures.
3. **Item 75** — decide the receipt. While `PaymentGateway` records unconditional success, a document titled `OFFICIAL RECEIPT` with a `TOTAL PAID` line and a 9-point disclaimer is the highest-consequence thing in the build.
4. **Items 76 / 12 / 35 / 86** — move the four browser-only guards to the API. Each is a few lines; together they are the difference between a validated system and a validated form.
5. **Item 18's leak** — strip `section / source` in `PaymentController::fee` regardless of how BPLO answers A12, because the API contract currently claims this is already done.
6. **Item 100** — deploy `9f3b489` so gateway hiccups stop reading as application failures. This is outward-facing: it drops open tester sessions and reissues the tunnel URL, so it needs your say-so and a quiet moment.
7. **Item 48** — stop officer-pending fees printing as `0.00` on the PDF. The screen already renders them as a dash for exactly this reason; the PDF never got the same treatment, and a bill claiming a fee is zero when it is merely unset is a false statement to a business owner.
8. **Appendix B's stale comments** — particularly `ClearanceStagePage.tsx`, where the comments would lead a reader to reintroduce the Market Clearance bug the handoff explicitly warns against.
